UI/UX DESIGN DOCUMENTATION

FLYANYTRIP WEBSITE UI

This document provides a comprehensive overview of the FlyAnyTrip web application's UI design, covering all key screens including Home, Flights, Hotels, Tour Packages, Holidays, and My Bookings & Support. It translates the finalized Figma designs into clear, structured documentation that helps developers understand implementation details while giving stakeholders a complete view of the design decisions, user experience, and interface specifications.

1. Document Overview

This document translates the **FAT Deliverables** Figma file into client-facing UI/UX documentation for the FlyAnyTrip travel booking platform. FlyAnyTrip is a full-service OTA (Online Travel Agency) covering four core verticals — **Flights, Hotels, Tour Packages and curated Holidays** — plus a shared **My Bookings & Support** utility area. The file contains 1 canvas ("Page 1") organized into 6 sections that mirror the product's information architecture, holding 36 unique screen frames and 3 shared components (Navbar variants).

Every screen below was pulled directly from the live Figma document (structure, copy, color fills and type styles were extracted programmatically from the Figma API) and is documented against a consistent 14-point framework — Purpose, Business Goal, User Goal, Key Components, Design Principles, Visual Hierarchy, Layout Analysis, UX Decisions, Accessibility, Responsive Behavior, Interaction Notes and Developer Notes — so design, product and engineering can all work from one source of truth.

Product	FlyAnyTrip — India-based multi-vertical travel booking platform (flights, hotels, tour packages, holidays)
Figma file	FAT Deliverables
Canvas	Page 1 — 6 sections, 36 documented screens
Primary frame size	1519 × variable (desktop web, ~1440px content container)
Currency / Locale	INR (₹), India default market, English

2. Design System Overview

FlyAnyTrip's design language is a **rounded, friendly, trust-forward** system built to make a high-stakes purchase (travel booking) feel simple and safe. It leans on a warm red brand color for action and energy, a soft rounded type family (Quicksand) for approachability, and a monospace type family (JetBrains Mono) for scannable transactional data (fares, PNRs, dates) — a deliberate pairing that separates "friendly marketing" content from "precise transactional" content.

- **Visual tone:** Clean e-commerce/OTA style — white canvas, card-based content, one dominant brand-red accent, generous white space between booking steps.
- **Interaction model:** Linear, step-based checkout (Screener/Listing → Detail → Traveler/Room/Seat → Personalize add-ons → Payment → Confirmation) repeated identically across all four booking verticals for learnability.
- **Trust signals:** Repeated on nearly every screen — security badges, "100% Secure Payments," PCI DSS / IATA marks, refund timelines, and 24/7 support callouts.
- **Consistency mechanism:** A persistent step-progress bar (Fill Your Info → Choose Seat/Room → Personalize Trip → Finalize Payment) plus a sticky booking-summary card anchor every checkout screen, so users always know where they are and what they owe.

3. Color Guide

Colors below are the actual fill values extracted from the Figma file's layers, grouped by functional role. Several near-duplicate hex values exist per role (e.g. three near-identical near-black text colors) — flagged as a **token consolidation opportunity** for the design system in Section 13.5.

#FE2C1C Brand Red — primary CTA	#FF2D1A Brand Red — alt (buttons)	#F54238 Brand Red — alt (badges/tags)	#2096F3 Accent Blue — links/info
#4CB04F Success Green — confirmed, savings	#FEC106 Amber — ratings, popular badges	#1B1B1B Near-black — primary text/footer bg	#272727 Near-black — alt heading text
#6B6B6B Secondary text / labels	#949494 Tertiary text / placeholders	#D0D0D0 Borders / dividers	#E2E2E2 Light borders / input strokes
#FCECEC Red tint — banner/pill backgrounds	#FFF6F6 Red tint — table row / field key bg	#FFBEB8 Red tint — hover/soft accents	#FFFFFF Canvas white — cards, page bg

Usage rule of thumb: Red = primary action / brand identity, Blue = informational link, Green = positive/confirmed state, Amber = social proof / rating, Neutrals = all typography and structural chrome. Reds and neutrals should be reduced to one token each per role during dev handoff (see 13.5).

4. Typography Guide

Type usage was tallied across all 36 screens (9,545+ text layers). Four families are in active use, each with a clear job:

Quicksand	Primary UI typeface (by far the most used — body copy, labels, buttons, nav, form fields). Rounded geometric sans that supports the platform's friendly, approachable tone. Weights in use: 500 (body), 600 (sub-emphasis), 700 (emphasis/labels). Sizes range ~11–17px.
JetBrains Mono	Secondary / data typeface. Used specifically for transactional, scannable values — prices, PNR/booking codes, flight numbers, dates, seat codes. The monospace rhythm makes numbers easy to compare at a glance and visually distinguishes "data" from "copy." Weights 500/700, sizes ~11–19px.
Satoshi	Primary heading typeface for marketing/section headers (e.g. "Popular Destinations," hero headline). Weights 400/500, sizes 18–24px, geometric and modern to contrast the rounded UI font.
Inter	Secondary heading/UI typeface appearing at ~20px, used in specific components (likely inherited from an earlier component set) — candidate for consolidation into Satoshi/Quicksand.
Font Awesome 5 Free	Icon font — renders iconography (search, filters, social, payment methods) as glyphs rather than SVG in several components.
Poppins / SF Pro Display / Intrepid	Minor incidental usage (under 60 instances total, likely a logo wordmark or a few unconverted legacy layers) — not part of the intentional system; recommend auditing and removing at dev handoff.

Type scale observed (rounded to nearest common web value): 11 / 12 / 13 / 14 / 15 / 16 / 17 / 19 / 20 / 22 / 24px. The fractional Figma values (e.g. 11.25, 13.125) indicate the frames were scaled ~1.06× from a 1440px base — engineering should treat the type scale as the rounded values above, not the literal decimals.

5. Iconography

- **Style:** Line/outline icons at small sizes (16–24px) for UI actions (filters, search, calendar, seat legend, social), supplemented by **Font Awesome 5 Free** glyphs for common actions and payment/social marks.
- **Emoji as functional icons:** The system deliberately uses emoji (🍷 🍺 🍹) for meal-preference selection across Flight, Tour and Holiday "Personalize" screens — a lightweight, zero-asset way to add color and quick recognition without custom illustration.
- **Status iconography:** Checkmarks (✓) for included amenities/inclusions, numbered circular steps (1-2-3-4) for refund/cancellation progress trackers, star ratings (★) for hotel/package quality.
- **Brand marks:** App Store / Google Play badges, payment app logos (GPay, PhonePe, Paytm, BHIM), and airline logos are used as real third-party marks — flag for licensing/usage-rights review before production use.
- **Recommendation:** Consolidate to a single icon set (e.g. Font Awesome or a custom SVG sprite) at dev handoff; mixing emoji + icon font + custom glyphs is fine at design stage but should resolve to one icon component library in code.

6. Grid System

- **Canvas:** Desktop-first single-frame design at 1519px width (≈ 1440 px content container scaled $\sim 1.06\times$) — no explicit mobile/tablet frames exist in the file.
- **Content grid:** 12-column grid inferred from card/tile groupings — Popular Destinations and Popular Flight Routes tiles lay out in 4-column and 6-column rows respectively; booking pages split into a $\sim 66/34$ two-column layout (form content + sticky summary card).
- **Spacing scale:** Consistent section padding (~ 40 – 60 px vertical between major blocks) and card gutters (~ 16 – 24 px), following an 8px base spacing unit typical of the observed component paddings.
- **Sticky summary pattern:** Every checkout step (Flight, Hotel, Tour, Holiday) reserves the right-hand column for a persistent booking/fare-summary card — a strong, intentional grid decision that keeps cost transparency visible through the entire funnel.
- **Responsive gap:** Because only desktop frames exist, responsive breakpoints (tablet ≤ 1024 px, mobile ≤ 480 px) are **not explicitly designed** — Section-level "Responsive Behavior" notes below describe the recommended reflow strategy engineering should implement.

7.1 — Home Page

Screen Name

Home Page

Purpose

The landing/marketing homepage and universal entry point for all four booking verticals — sets brand tone and routes users into a search flow within seconds of arrival.

Business Goal

Maximize conversion into a search (top-of-funnel capture) by combining a multi-vertical search widget with merchandised deals (destinations, flight routes, hotel deals) that create urgency and cross-sell across products.

User Goal

Quickly search or discover a trip idea — either they know exactly what they want (search widget) or they are browsing for inspiration (curated deal rails).

Key Components

- Sticky top utility bar
- Universal search widget (tabs: Flights/Hotels/Holiday)
- Trip-type selector (Round Trip/Multi-City/One Way)
- Trust-signal strip
- Destination card rail
- Flight route price rail
- Hotel deal cards
- "Why Choose Us" USP grid
- Testimonial carousel
- FAQ accordion
- App download CTA
- Mega-footer

Design Principles

- Progressive disclosure — one primary action (search) above the fold, discovery content below the fold
- Social proof stacked immediately under the hero (5M+ travellers, guarantees) to reduce first-visit anxiety
- Repetition of card patterns across destination/route/hotel rails for fast visual learning

Visual Hierarchy

Hero headline "Your Journey Begins Here" + search widget dominates the first viewport with high contrast (dark hero, red CTA). Below, each rail uses a consistent label + subtext + "View All" pattern so users can scan section by section without re-learning structure.

Layout Analysis

Full-width hero with right-aligned aircraft photography and a floating white search card that overlaps the hero/body boundary — a common OTA pattern that visually "anchors" the primary action. Below, content reflows into a centered max-width column with card grids (4–6 per row).

UX Decisions

- Search widget is tabbed (Flights/Hotels/Holiday) rather than three separate widgets — keeps the hero compact and puts all entry points one click apart.
- Trust badges (Secure Payments, Best Price Guarantee, Instant Confirmation, 24/7 Support, 5M+ travellers) placed directly beneath the fold-line, front-loading credibility before any pricing is shown.
- Deal rails default to horizontal card scanning with explicit currency/pricing shown up front (₹8,999 style) to pre-qualify price expectations before click-through.

Accessibility	• Hero text is white-on-dark photographic background — verify a scrim/overlay maintains 4.5:1 contrast across the full image, not just the darkest region. • Tab controls (Flights/Hotels/Holiday) need visible focus states and role="tab" semantics for keyboard/screen-reader parity. • Card CTAs ("View All Packages," "View All Routes") should have unique accessible names per rail, not generic duplicate link text.
Responsive Behavior	• Mobile: collapse the tabbed search widget into a full-width stacked form; move aircraft hero image behind/above the form or remove for space. • Destination/route/hotel rails convert to horizontal swipeable carousels (1.2 cards visible) rather than fixed 4–6 column grids. • Sticky utility bar reduces to a hamburger + logo + search icon.
Interaction Notes	• Trip-type selector (Round Trip/Multi-City/One Way) changes the form fields shown (e.g., Multi-City adds legs) — should animate the field-set change rather than hard cut. • FAQ items are an accordion (single-open recommended) based on the repeated Q/A text pattern. • Search button submits the active tab's form and routes to that vertical's Screener/Listing screen.
Developer Notes	• Build search widget as one reusable component with a `vertical` prop (flights/hotels/holiday) rather than three components — this repeats verbatim on Hotel and Holiday listing pages. • Price fields throughout should render in JetBrains Mono; all other copy in Quicksand — enforce via a Price/Amount text component, not inline styles. • Footer is identical across all 36 screens — extract as a single shared component immediately.

COMPONENT SIZES & DIMENSIONS

8.1 — Flight Screener (Search Results)

Screen Name

Flight Screener (Search Results)

Purpose

Primary flight results/comparison screen — lets users filter a large result set (24+ flights) down to the one that fits their price, timing and airline preference.

Business Goal

Keep users on-platform by surfacing enough filtering power (stops, airline, price, time-of-day) to avoid drop-off to competitor OTAs, while merchandising a fare calendar to upsell cheaper adjacent dates.

User Goal

Compare flights fast and narrow down to the best option on price and convenience without losing the original search context.

Key Components

Modify-search summary bar

Fare-type tabs (Regular/Student/Armed Forces/Senior Citizen)

Filter sidebar (Stops, Airlines, Price range slider, Departure/Arrival time)

Sort control (Cheapest/Fastest/Best)

Fare calendar strip

Flight result cards

Result count indicator

Design Principles

- Filters-left, results-right is the OTA industry-standard pattern — minimizes relearning for travel-savvy users.
- Persistent "Modify Search" bar removes need to restart a search for small changes.
- Fare-type tabs surface fare eligibility (student/senior/forces) as a first-class filter, not buried in results.

Visual Hierarchy

Search summary bar at top (smallest but most frequently referenced), filter sidebar secondary, result cards primary with price in the most visually dominant position (bold, brand color or dark, largest numeral) on each card.

Layout Analysis

Two-column layout: fixed-width left filter rail (collapsible via "Hide Filters") and flexible right result list. Fare calendar sits as a full-width horizontal strip above the list, letting users compare price-by-date without leaving the page.

UX Decisions

- Filters show live counts/prices next to each option (e.g. "₹2,599 · 1 Stop") so filtering doubles as price discovery.
- "Hide Filters" toggle gives power users more horizontal room for comparing results once their filter set is chosen.
- Sort defaults are exposed as three clear tabs (Cheapest/Fastest/Best) rather than a hidden dropdown — reduces a click for the most common action.

Accessibility	• Price-range slider and time-range checkboxes need full keyboard operability and ARIA slider roles, not just mouse drag. • Result cards should expose flight number, times and price as readable text order for screen readers, matching the visual left-to-right scan order. • Color must not be the only signal for "cheapest"/"best" tags — pair with text labels (already present) and sufficient contrast.
Responsive Behavior	• Mobile: filter sidebar becomes a full-screen modal/bottom-sheet triggered by a "Filters" button; results become single-column full-width cards. • Fare calendar strip becomes a horizontally swipeable scroller with 3–4 dates visible. • Sort control collapses into a single dropdown to save header space.
Interaction Notes	• Selecting a filter should update result count and price ranges in real time (optimistic UI) rather than requiring an "Apply" click, matching the live counts already shown. • Fare calendar date selection re-queries results for that date without a full page reload. • Clicking a result card advances to Passenger Details, carrying the selected fare into the sticky Booking Summary component used through the rest of the funnel.
Developer Notes	• This screen and its "Pop up" variant (8.2) share ~95% of layout — implement filters as an overlay/drawer state of the same component rather than a duplicate screen. • Flight result card is the most reused component in the Flights vertical — build once, reuse in calendar-linked results and the personalize/summary rail thumbnail. • Note: Figma frame is literally named "Flight Screener Pop up" for the filter-open state — confirm intended interaction (modal vs. inline expand) with design before build.

8.2 — Flight Screener — Filter Panel (Pop-up State)

Screen Name	Flight Screener — Filter Panel (Pop-up State)
Purpose	Represents the same Flight Screener with its filter panel in an expanded/active (pop-up) interaction state — documented separately in Figma to spec the open-filter appearance.
Business Goal	Ensure the filtering experience — the main lever against drop-off — is fully specified in its "in-use" state, not just its default/idle state.
User Goal	Actively refine results (e.g. narrow by airline or price) while still seeing enough result context to judge impact of each filter change.
Key Components	Same filter sidebar as 8.1 (Stops/Airlines/Price/Time) Fare-type tabs Result list (partially visible/dimmed context) Fare calendar strip
Design Principles	- State parity — every interactive panel should have both a documented default and active state so engineering does not need to guess the open/expanded appearance. - Context preservation — filter panel overlays without fully hiding result content, reinforcing cause → effect of each filter toggle.
Visual Hierarchy	Identical to the base screener; the filter panel content becomes the active focus while result cards remain visible as supporting context, not hidden.
Layout Analysis	Same two-column grid as 8.1; this frame effectively duplicates the base screen structure to lock the filter-panel content as its own specifiable artifact.
UX Decisions	- Keeping results visible alongside the open filter panel (rather than a full-screen takeover) lets users see result-count feedback without a modal round-trip. - Reusing the identical header/search-summary bar avoids re-orientation cost when the filter state opens.
Accessibility	- If implemented as a modal/drawer, trap focus within the panel and return focus to the trigger button on close. - Announce updated result counts via an ARIA live region when a filter changes.
Responsive Behavior	On mobile this state should become the primary filter interaction (bottom-sheet), since sidebar-and-results side-by-side is not viable at narrow widths.
Interaction Notes	Recommend this be a shared component state (open/closed) rather than a second screen in the design system — flag to the client's design team for consolidation in Figma.

Developer Notes

- Do not build as a separate route/page — implement as a state variant (`filtersOpen: true`) of the Flight Screener component from 8.1.
- Confirm with stakeholders whether this is intended as an inline drawer or true modal overlay before implementation; current Figma naming ("Pop up") suggests modal.

Base Fare ₹3,400
Taxes & Fees ₹519
Total **₹3,919**

Screen Name

Passenger Details

Purpose

First step of checkout — collects contact and passenger information required to issue a valid ticket.

Business Goal

Capture accurate, government-ID-matching passenger data to minimize post-booking name-correction support tickets and airline rejections, while keeping the fare visible to reduce cart abandonment.

User Goal

Enter their (and co-travellers') details correctly and quickly, and see confirmation the fare hasn't changed before paying.

Key Components

4-step progress bar (Fill Your Info/Choose Seat/Personalize Trip/Finalize Payment)

Contact information form

Passenger detail form (repeatable per passenger)

"Add Another Passenger" action

Sticky Booking Summary card

Sticky Fare Summary card

App download banner

Mega-footer

Design Principles

- Required-field marking (*) and inline helper text (e.g. "Passport details required for international flights") reduce validation errors before submission.
- Two-column split (form + summary) keeps cost/itinerary anchored while the form scrolls — reduces anxiety about "what am I paying for" mid-form.

Visual Hierarchy

Step progress bar orients the user first; "Contact Information" and "Passenger Details" section headers break the long form into digestible chunks; the fare Total is bolded and isolated at the bottom of the summary card as the key number.

Layout Analysis

~66/34 two-column layout: left column scrollable form content grouped into labeled cards (Contact Information, Passenger Details), right column a non-scrolling sticky summary showing flight route, timing and fare breakdown.

UX Decisions

- Passport fields are conditionally relevant ("required for international flights") — implies the form should conditionally show/require them based on route, not always display as optional.
- Adding passengers is additive via "+ Add Another Passenger" rather than a fixed count selected earlier — supports the 1 Adult default carried from the Screener while allowing correction.
- Booking summary repeats flight number, route, date/time and fare on every checkout step — a deliberate redundancy that prevents users from losing context if they scroll a long form.

Accessibility	• All required fields need programmatic `required`/`aria-required` plus visible error states — asterisk alone is not enough for screen reader users. • Date of birth split fields (DD/MM/YYYY) should be a single accessible date input or clearly labeled grouped fields with a fieldset/legend. • Ensure sticky summary card does not trap keyboard focus or obscure form fields when both are visible on smaller viewports.
Responsive Behavior	• Below ~1024px, the sticky summary card should move to a collapsible bar (e.g. "View fare details ▼") pinned above or below the form rather than a fixed side column. • Passenger detail groups should stack single-column on mobile with full-width inputs.
Interaction Notes	• "Continue" is disabled until required fields validate; consider inline validation on blur rather than only on submit given the form length. • Passport Expiry uses a placeholder date-format pattern — should open a date picker rather than free text to avoid format errors.
Developer Notes	• Passenger Details is a repeatable form block — model as an array-backed form (one entry per passenger) rather than hard-coded fields. • Sticky Booking Summary + Fare Summary is reused verbatim across Flight, Hotel, Tour and Holiday checkout screens — build one shared "TripSummaryCard" component with props for item type.

8.4 — Seat Selection

Screen Name	Seat Selection
Purpose	Optional/premium seat map lets the user choose (or skip) a specific seat before moving on to trip personalization.
Business Goal	Ancillary revenue opportunity — seat selection is a common upsell in OTA models even where not explicitly priced on this frame; also improves satisfaction by giving control over seating.
User Goal	Pick a seat that matches their preference (window, extra legroom/exit row) or confirm they're fine with a system-assigned seat.
Key Components	4-step progress bar Seat map grid (rows 1–8+, columns A–F) Legend (Taken/Selected/Available) Window and Exit Row indicators
Design Principles	- Visual seat-map metaphor mirrors the real aircraft cabin layout — instantly familiar from airline check-in experiences, no learning curve. - Clear 3-state legend (Taken/Selected/Available) removes ambiguity before a single seat is tapped.
Visual Hierarchy	Legend sits above the map so meaning is established before scanning individual seats; row/column labels (1–8, A–F) are secondary but essential wayfinding text.
Layout Analysis	Centered single-column seat grid, likely scrollable for aircraft with more rows than fit in the viewport; window/exit-row markers sit at the grid edges as contextual annotations.
UX Decisions	- Skippable step (implied by the funnel allowing "system assigned (free)" per the confirmation screen's summary) — respects users who don't care about seat choice. - Simple 3-color legend rather than pricing-tiered seat map keeps this decision fast, though this limits upsell — flag for business review if paid seat tiers are planned.
Accessibility	- Each seat needs an accessible name announcing row, column and status (e.g. "Seat 14C, window, available") — a visual grid alone is not screen-reader usable. - Color-only Taken/Selected/Available states must be paired with icons or patterns (e.g. an X for taken) for color-blind users. - Ensure sufficient touch-target size (≥44px) per seat cell for mobile/tablet use.
Responsive Behavior	- Seat grid should support pinch-zoom or a horizontally scrollable container on mobile, since a 6-column dense grid will be cramped under ~400px width. - Legend can move to a collapsible tooltip on very small screens to save vertical space.

Interaction Notes	• Tapping an available seat should toggle to "Selected" and update any fare-impact if seat is chargeable; tapping a Taken seat should be a no-op with a subtle disabled affordance. • Continuing without selecting a seat should default to system-assignment, consistent with the confirmation summary language elsewhere in the flow.
Developer Notes	• Model seat map data-driven (rows × columns × status) from an API response, not hard-coded per aircraft — layout must support varying aircraft configurations. • This screen currently has no visible fare/summary sidebar in the extracted frame — confirm with design whether the sticky Booking/Fare summary (present on 8.3, 8.5, 8.6) was intentionally omitted here or missed in the export.

8.5 — Personalize Trip (Add-ons)

Screen Name	Personalize Trip (Add-ons)
Purpose	Upsell screen offering meal preferences and ancillary add-ons (baggage, boarding priority, Wi-Fi, insurance) before final payment.
Business Goal	Core ancillary-revenue screen of the funnel — every add-on (baggage +₹799/₹1,399, priority boarding +₹299, Wi-Fi +₹499, insurance ₹149) is incremental margin on top of the base fare.
User Goal	Customize the trip to their comfort/need level (food, luggage, connectivity, protection) without feeling pressured, and see exactly what each add-on costs before committing.
Key Components	4-step progress bar - Meal-preference selector (emoji-coded: Vegetarian/Non-Veg/Vegan/Jain/No Preference) - Add-on service cards (Extra Baggage 15kg/30kg, Priority Boarding, In-flight Wi-Fi, Travel Insurance) "Popular"/"Better value"/"Recommended" merchandising badges +Add action per add-on - Sticky Booking & Fare Summary
Design Principles	- Anchoring and social proof badges ("Popular," "Recommended," "Better value") guide choice architecture toward higher-margin options without being manipulative — prices are always shown plainly alongside. - Emoji + label meal cards reduce cognitive load versus a plain dropdown, and add warmth to a transactional screen.
Visual Hierarchy	Meal preference (free-to-low-cost, universally relevant) is positioned above paid add-ons, following a "low-commitment first" ordering that eases users into the upsell sequence.
Layout Analysis	Vertically stacked card list for add-ons, each with icon/label, short benefit copy, price and a discrete "+Add" button; sticky summary column persists on the right as in all other checkout steps.
UX Decisions	- Each add-on states the "why" in one short line (e.g. "Board first, best overhead bin space") rather than just a product name — improves perceived value of the upsell. - Insurance is framed with concrete coverage detail (₹5L coverage · cancellation · medical · baggage) rather than a vague "protect your trip," building trust for a product users often skip. "No Preference / Free" is listed as a clear, equally-weighted meal option — avoids dark-pattern pressure to pick a paid meal.

Accessibility	• Emoji meal icons must have accompanying text labels (already present) so screen readers announce "Vegetarian," not just an emoji character. • "+Add" buttons need distinct accessible names per add-on (e.g. "Add Extra Baggage 15kg for ₹799"), not generic repeated "Add" text. • Badges like "Popular"/"Recommended" should not be the only visual differentiator — ensure sufficient text contrast against their pill backgrounds.
Responsive Behavior	• Add-on cards stack full-width on mobile; consider condensing to a compact list-row pattern (icon + title + price + toggle) to reduce scroll length. • Sticky fare summary collapses to a bottom sticky bar showing running total on mobile.
Interaction Notes	• Selecting "+Add" should immediately update the sticky Fare Summary total (optimistic UI), giving instant cost feedback for each add-on toggle. • Meal preference is single-select (radio behavior); add-ons are independent multi-select toggles.
Developer Notes	• Add-on card is a reusable pattern — same structure reused in Hotel "Enhance Your Stay" (9.5) and Tour/Holiday Personalize screens; build one AddOnCard component with content-driven props. • Fare total must recompute reactively from selected add-ons + base fare — keep pricing logic centralized, not duplicated per screen.

8.6 — Payment — Method Selection

Screen Name	Payment — Method Selection
Purpose	Final payment collection screen — lets the user apply a coupon and choose/enter a payment method to authorize charge.
Business Goal	Minimize final-step drop-off by supporting India's dominant payment rails (UPI first, then card/net banking/wallets) and offering last-chance discount codes to nudge completion.
User Goal	Pay quickly and securely using their preferred method, ideally applying a discount code first.
Key Components	- Coupon code input + Apply button - Suggested coupon chips (HDFC15, FLY200, FIRSTFLY) - Payment method tabs (UPI/Credit-Debit Card/Net Banking/Wallets) - UPI ID input + popular UPI app icons (GPay/PhonePe/Paytm/BHIM) - QR code pay option - Primary "Pay ₹X Securely" CTA - Terms & Privacy Policy disclosure - Sticky Booking/Fare Summary
Design Principles	- UPI is presented as the default/first tab — reflects real Indian payment-method popularity and reduces friction for the majority use case. - Coupon suggestions are shown as tappable chips rather than requiring users to know/remember a code — increases redemption and perceived savings.
Visual Hierarchy	Payment method tabs are the dominant interactive element; the "Pay ₹X Securely" button is the single highest-contrast, largest element on the page — deliberately the last and only required action.
Layout Analysis	Coupon module sits above the payment-method tab group; tab content (UPI/Card/etc.) swaps in the same panel area; sticky summary card persists at right, now showing the final payable total that matches the CTA button label.
UX Decisions	- CTA button label restates the exact amount ("Pay ₹3,919 Securely") rather than a generic "Pay Now" — reduces last-second hesitation from uncertainty about final cost. - The word "Securely" plus adjacent Terms/Privacy disclosure directly under the button reinforces trust at the highest-anxiety moment of the funnel. - QR-code fallback for UPI supports desktop users paying via a mobile banking app without re-typing a UPI ID.

Accessibility	• Payment method tabs must be operable via keyboard (arrow keys between tabs) with visible focus and correct ARIA tab/tabpanel roles. • UPI app icons (GPay/PhonePe/etc.) need text alternatives, not icon-only buttons. • Coupon "Apply" success/failure state must be announced (ARIA live region), not conveyed by color alone.
Responsive Behavior	• Payment tabs convert to a horizontally scrollable tab strip or accordion on mobile. • QR code should only render on breakpoints where it's actionable (desktop) — on mobile, prioritize the UPI-ID/app-intent flow instead.
Interaction Notes	• Applying a valid coupon should instantly recompute and reflect the new total in both the CTA button and the sticky Fare Summary. • Switching payment method tabs should not lose an already-entered coupon code — treat coupon state independently from payment-method state.
Developer Notes	• This Figma frame is named "Flight Finalize Payment" but its content is the payment *method selection* step, not a confirmation — there is a second, differently-scoped frame with the same name (8.8) which is the actual post-payment confirmation. Rename in Figma to avoid ambiguity (e.g. "Payment Method" vs. "Booking Confirmed"). • Payment method module (UPI/Card/NetBanking/Wallets) is identical across Flight, Hotel, Tour and Holiday — extract as one PaymentMethodPicker component.

8.7 — Payment — Pre-confirmation Review

Screen Name	Payment — Pre-confirmation Review
Purpose	A final read-only review of the booking and fare breakdown immediately before the user is handed off to the secure payment gateway.
Business Goal	Reduce payment-gateway abandonment and chargeback/dispute risk by giving the user one last unambiguous summary (flight, passenger, seat, meal, total) with explicit security assurances before charging.
User Goal	Double-check every detail is correct (flight time, fare, add-ons) before authorizing payment, and feel confident the payment step itself is secure.
Key Components	4-step progress bar - Read-only booking summary block (flight/passenger/seat/meal) - Fare breakdown (Base/Taxes/Total) - Security/trust microcopy (PCI DSS Level 1, 256-bit SSL, "No charges until payment confirmed") - Primary "Pay ₹X Securely" CTA - Sticky Booking/Fare Summary sidebar
Design Principles	- Redundant confirmation before an irreversible action (payment) — a deliberate extra step that trades one click of friction for meaningfully reduced error/regret and support load. - Explicit security certifications (PCI DSS, SSL) placed adjacent to the action, not buried in a footer, to reduce hesitation at the highest-stakes click.
Visual Hierarchy	Fare "Total Payable" is the single largest/boldest number on the page; the CTA button restates this exact figure to create a tight visual/cognitive link between "what I'm confirming" and "what I'm about to pay."
Layout Analysis	Single-column review card stacked above the CTA, with the familiar sticky summary sidebar retained at right for consistency, even though its content now duplicates the main review — intentional redundancy for scan-confidence.
UX Decisions	- Listing seat and meal choice explicitly ("Seat: System assigned (free)," "Meal: No Preference") even when defaults were taken shows the user their non-choices were still respected/recorded. - Security microcopy is written in plain language ("No charges until payment confirmed") rather than only technical certification badges — speaks to both technical and non-technical users.
Accessibility	- Ensure the review content is structured with proper headings/labels so screen reader users get the same "read before you pay" safety net as sighted users. - CTA button text should not rely on color alone to signal it is the primary action — sufficient size/weight/contrast already implied by design.

Responsive Behavior	On mobile, collapse the duplicate sticky summary sidebar entirely on this screen (since content is redundant with the main review) to shorten an already long confirmation flow.
Interaction Notes	- This step should be positioned as the true "point of no return" gate — clicking Pay should hand off to a payment gateway (internal or third-party) rather than performing payment logic on this screen itself. - Back-navigation from here should return to Personalize/Payment-method without losing entered coupon or add-on selections.
Developer Notes	- Treat this as a distinct "Review" state that always precedes the actual payment-gateway handoff, across all four verticals — same pattern appears in Hotel (9.6), Tour (10.5) and Holiday (12.6). - Security certification copy (PCI DSS / SSL / IATA) should be sourced from a shared trust-badge component/config, not hard-coded per screen, so it stays accurate if certifications change.

8.8 — Booking Confirmation

Screen Name	Booking Confirmation
Purpose	Post-payment confirmation screen — confirms the ticket is booked, provides the PNR, full flight/passenger/payment record, and next actions (boarding pass, check-in, manage booking).
Business Goal	Close the transaction with confidence (reduce post-purchase anxiety and "did it go through" support tickets), while cross-selling the app download and capturing a satisfaction rating/review.
User Goal	Get proof of a successful booking (PNR), understand exactly what was booked and paid, and know what to do next (download boarding pass, check in, manage booking).
Key Components	Header utility bar + primary nav (now showing "My Bookings/Support/Login" — post-auth context) Success headline + PNR block with Copy action Flight details table (route, date, terminal/gate, duration) Passenger details table (name, seat, baggage, meal) Payment summary table (fare, taxes, total, method, transaction ID) Refund-status stepper (pre-populated, inactive state) Booking action buttons (Download Boarding Pass/Email Ticket/Web Check-in/Manage Booking) Rate-experience prompt App download banner + mega-footer
Design Principles	- Single unmistakable success state (headline + PNR) at the very top before any dense data — user gets the "it worked" signal in under a second. - Information density increases progressively down the page (headline → key facts → full data tables) so users can stop reading as soon as they have what they need.
Visual Hierarchy	Success headline and PNR number are the largest, most prominent elements; supporting tables use a consistent label/value row pattern (matching the fare-summary style used throughout the funnel) so the eye can scan efficiently.
Layout Analysis	Long single-column confirmation document: hero success block → PNR → structured detail tables → status stepper → action buttons → soft cross-sell (app, rating) → shared footer. No competing sidebar at this stage — full width is given to the confirmation record.
UX Decisions	"Copy" action next to the PNR removes transcription errors when users need to paste it elsewhere (airline site, calendar invite). - A 4-step Refund Status tracker is shown pre-emptively even though no cancellation was requested ("₹0 not requested") — sets expectations early so users know exactly what a future cancellation would look like. - Primary actions (Download Boarding Pass, Web Check-in) are surfaced immediately rather than requiring a trip to "My Bookings" first.

Accessibility	• PNR and transaction ID should be marked up as selectable, readable text (not an image) with an accessible "Copy to clipboard" button announcing success. • The refund-status stepper needs text-equivalent state labels for each step (not just numbered circles), already partially present — ensure current/inactive step is programmatically distinguishable. • Data tables (Flight/Passenger/Payment) should use semantic table markup with header associations for screen-reader table navigation.
Responsive Behavior	• Detail tables reflow from two-column label/value rows to stacked label-over-value on mobile to avoid horizontal truncation of longer values (e.g. terminal/gate info). • Action buttons (Download/Email/Check-in/Manage) stack into a full-width vertical button group on small screens.
Interaction Notes	• "Download Boarding Pass" should only be enabled once web check-in has opened (typically 24–48h before departure) — consider a disabled/tooltip state pre-check-in rather than removing the button. • Rating prompt should be dismissible without blocking access to booking actions.
Developer Notes	• This is the true confirmation screen despite sharing the Figma frame name "Flight Finalize Payment" with 8.6 — rename to "Flight Booking Confirmation" in source file to prevent build ambiguity. • PNR, passenger, payment and refund-stepper blocks follow the exact same structure as Hotel Confirmation (9.8), Tour Confirmation (10.7) and Holiday Confirmation (12.8) — build one ConfirmationTemplate component parameterized by booking type. • Refund-status stepper values should be driven by real booking-state from the backend, not static/always-inactive as shown in the mock.

9.1 — Hotel Search Results

Screen Name

Hotel Search Results

Purpose

Lists hotel properties for the searched destination/dates, with filtering by price, star rating, amenities, property type and locality.

Business Goal

Surface the highest-margin/most bookable inventory first (e.g. "Luxury" tag, 30% off badges) while giving enough filter depth to prevent bounce to competing OTAs.

User Goal

Compare available hotels for their trip dates and narrow down to one within budget and preferred amenities/location.

Key Components

Trip context bar (destination, dates, room/guest count, Map View, Modify)

Filter sidebar (Price range, Star rating, Amenities, Property type, Area/Locality)

Sort control (Popularity/Price/Rating)

Result count indicator

Hotel result cards (image, name, location, review count, amenity chips, description, strikethrough price + discount + final price + tax note, Book Now CTA)

Design Principles

- Same filter-left/results-right pattern as Flight Screener for cross-vertical consistency and reduced relearning cost.
- Price-anchoring on each card (crossed-out original price next to a red discounted price) creates a persistent sense of deal value across the whole list.

Visual Hierarchy

Hotel name and photo dominate each card; discounted price is the second-largest, highest-contrast element (bold red), positioned bottom-right where the eye naturally lands last, next to the CTA.

Layout Analysis

Two-column layout mirroring the Flight Screener — persistent left filter rail, scrollable right result list, "Map View" toggle offering an alternate spatial browsing mode not detailed in this frame.

UX Decisions

- Amenity chips (Free Wifi/Pool/Spa/Gym/Parking) are filterable and shown per-card, letting users pattern-match filters directly against result content.
- Property Type (Hotel/Resort/Hostel/Villa) as a first-class filter acknowledges FlyAnyTrip serves varied trip types (backpacker to luxury) with one search UI.
- "per night" plus a separate "+taxes" line is disclosed on every card, avoiding a bait-and-switch total at checkout.

Accessibility

- Amenity icon chips need text labels (already present) — do not rely on icon-only recognition.
- Struck-through original price must have a text equivalent (e.g. "was ₹14,000") for screen readers, not just a visual strikethrough style.
- Map View toggle needs a clear accessible name distinguishing it from the default list view.

Responsive Behavior	- Filters collapse into a "Filters" button opening a bottom-sheet/modal on mobile, matching the Flight Screener pattern. - Hotel cards go full-width single column; amenity chips wrap or truncate to a "+N more" pattern.
Interaction Notes	- Star-rating filter options ("& above") behave as minimum-threshold toggles, not exact-match — should be clearly indicated in the UI copy/tooltip. - Clicking a result card or "Book Now" navigates to Hotel Detail (9.2), carrying forward dates/guests context shown in the trip context bar.
Developer Notes	- Hotel result card mirrors the Flight result card pattern (image+meta+price+CTA) — consider a shared "ListingCard" base component with slot-based content per vertical. - Filter sidebar structure (price/rating/amenities/type/locality) is near-identical to Flight/Tour/Holiday filter panels — extract a generic FilterSidebar component driven by a filter-schema config.

9.2 — Hotel Detail

Screen Name	Hotel Detail
Purpose	Full property page — photos, description, amenities, policies, location/nearby distances, and guest reviews — to build enough confidence for the user to proceed to room selection.
Business Goal	Reduce return/refund/complaint risk by setting accurate expectations (policies, distances, reviews) up front, and increase conversion via detailed social proof (4.6★, 3,120 reviews).
User Goal	Verify this specific hotel truly fits their needs (location, amenities, policies) before choosing a room and paying.
Key Components	- Breadcrumb (Home / Hotels / [Property]) - Photo gallery + "View all photos" - Property header (name, location, rating, Save/Share) - About This Hotel description + highlight tags - Hotel Amenities grid - Hotel Policies table (Check-in/Check-out/Cancellation) - Location & Nearby distance list - Guest Reviews summary (overall + sub-scores: Location/Cleanliness/Service/Rooms/Value) + individual review cards - Similar Hotels rail
Design Principles	- Layered trust-building: photos (emotional) → description/highlights (informational) → amenities/policies (practical) → reviews (social proof) → similar options (safety net if this isn't right) — a deliberate persuasion funnel within a single page. - Sub-scored reviews (Location/Cleanliness/Service/Rooms/Value) let users weight what matters most to them rather than trusting one aggregate number.
Visual Hierarchy	Photo gallery and property name/rating anchor the top; the 4.6 rating badge is repeated (header + reviews section) as a consistent trust anchor throughout the scroll.
Layout Analysis	Long single-column editorial layout broken into clearly labeled sections, each independently scannable; "Similar Hotels" rail at the bottom acts as a safety-net exit that keeps the user in-funnel if this property doesn't convert.
UX Decisions	- Policies (check-in/out, cancellation) are shown before booking, not hidden until after payment — reduces disputes and builds trust for a cancellation-anxious segment. - Nearby distances are given in concrete km/on-property terms (e.g. "Mobor Beach — 1 km") rather than vague "near beach" copy. "Save" and "Share" are placed at the same prominence as the title, supporting both a wishlist-style return-visit path and social/organic distribution.

Accessibility	• Photo gallery needs keyboard-navigable controls and alt text per image describing the room/property view shown. • Sub-score bars/numbers (Location 4.8, Cleanliness 4.7, etc.) should be exposed as text, not solely as visual bar-fill graphics. • Review cards should associate reviewer name/date/text in a logical reading order for assistive tech.
Responsive Behavior	• Photo gallery becomes a swipeable single-image carousel on mobile with a "1/18" counter replacing the multi-thumbnail grid. • Amenities/Policies grids collapse to single column; Nearby list remains a simple stacked list.
Interaction Notes	• Clicking any room-adjacent CTA (implied "Book"/"Select Room") proceeds to Room Selection (9.3); "View all photos" opens a lightbox gallery overlay. • Review sub-scores could be interactive filters (e.g. sort reviews by "Cleanliness") — confirm intended behavior with design if not purely decorative.
Developer Notes	• Break this page into independently loadable sections (gallery, description, amenities, policies, location, reviews) so slow review-API calls don't block the whole page render. • Guest review sub-scores and the overall Guest Reviews block reuse the exact rating-summary pattern seen on Tour/Holiday package detail pages — extract as a shared ReviewSummary component.

9.3 — Room Selection

Screen Name	Room Selection
Purpose	Lets the user choose a specific room type/rate (Superior/Deluxe/Premium Suite) for their selected property and dates.
Business Goal	Upsell room-tier margin by presenting a clear good/better/best ladder (₹9,800 → ₹13,500 → ₹22,800) with differentiated view/amenity value at each tier.
User Goal	Pick the room that best matches their budget and desired view/space/amenities for the stay.
Key Components	3-step progress bar (Fill Your Info/Personalize Trip/Finalize Payment) - Trip context header (property, dates, nights, guests) - Room type cards (bed config, guest capacity, view, size in sqm, included amenities, price with discount, Select CTA) - Sticky booking summary (property, no-room-selected state, check-in/out, guests, price summary, cancellation policy)
Design Principles	- Good/Better/Best pricing ladder is a proven upsell pattern — Deluxe Sea View sits as the natural "compromise" choice between Superior (cheapest) and Premium Suite (most expensive). - Room differentiation is expressed through concrete, comparable attributes (view, size, amenities) rather than marketing adjectives alone.
Visual Hierarchy	Room name and price are the dominant elements per card; amenity checkmarks (WiFi/AC/Mini-bar/Jacuzzi) are secondary but scannable at a glance via consistent iconography.
Layout Analysis	Vertically stacked room cards in the main column; sticky summary at right updates from "No room selected yet" to reflect the chosen room once selected, reinforcing the two-column pattern used throughout checkout.
UX Decisions	- Discount framing (₹14,000 struck through → ₹9,800) is repeated per room card, keeping the "deal" narrative alive at the point of highest-consideration decision-making. "Please select a room to continue" gates the Continue action, preventing users from proceeding without an explicit choice. - Free cancellation policy is restated in the sticky summary at this step — reinforces low-risk commitment right as the user is about to commit financially.

Accessibility	- Room cards' "Select" buttons need distinguishable accessible names per room (e.g. "Select Deluxe Sea View — ₹13,500/night"), not generic repeated "Select" text. - Amenity checkmarks (✓ WiFi, ✓ AC) should have text alternatives beyond the glyph for screen reader clarity. - Selected-state should be conveyed by more than color/border alone (e.g. a checkmark or "Selected" label) once a room is chosen.
Responsive Behavior	- Room cards stack full-width; comparison across tiers is harder on mobile — consider a swipe-compare or a condensed price-first list with expandable details. - Sticky summary collapses to a bottom bar showing selected room + running total.
Interaction Notes	- Selecting a room should update the sticky summary in place (property/no-room state → chosen room details) without navigating away. - Continue is disabled until a room is selected, then proceeds to Guest Details (9.4).
Developer Notes	- Room card pricing/discount logic mirrors the Hotel Search Results card and should share a Price/Discount sub-component. - Sticky summary card needs distinct empty ("No room selected yet") vs. filled states — implement as conditional rendering off a single `selectedRoom` state, not two separate components.

9.4 — Guest Details

Screen Name	Guest Details
Purpose	Collects contact info and lead-guest identity details required to issue the hotel voucher/check-in.
Business Goal	Capture accurate lead-guest ID data (matching Indian hotel-industry norms — Aadhaar/ID type) to prevent check-in friction and reduce property-side disputes.
User Goal	Provide their details quickly and confirm the room/stay details are exactly what they expect before paying.
Key Components	3-step progress bar Trip context header Contact Information form (mobile, email) Lead Guest Details form (title, name, ID type dropdown, ID number) with "Must be 18+" note Sticky summary (room, dates, guests, price breakdown, cancellation policy)
Design Principles	- Minimal required fields for a hotel booking versus flight (no passport/DOB needed domestically) — form length is deliberately proportional to actual risk/compliance need per vertical. - ID-type as a dropdown (e.g. Aadhaar Card) rather than a fixed field accommodates multiple valid Indian ID types.
Visual Hierarchy	Section headers ("Contact Information," "Lead Guest Details") break the short form into two clear chunks; sticky summary's "Total" remains the most visually weighted number, consistent with all other checkout screens.
Layout Analysis	Same ~66/34 two-column pattern as Flight Passenger Details, reinforcing the cross-vertical checkout template.
UX Decisions	"Must be 18+" is stated inline near the Lead Guest fields — sets a legal/policy expectation before submission rather than rejecting after the fact. - Only one guest's full ID details are collected (lead guest) rather than every guest, reflecting real hotel check-in practice (only the lead guest presents ID) and shortening the form versus the Flight equivalent.
Accessibility	- ID Type dropdown and ID Number field should be programmatically linked (label/for) and validated with format hints appropriate to the selected ID type. "Must be 18+" should be associated with its relevant field via aria-describedby, not just visually adjacent text.
Responsive Behavior	Form fields stack full-width single column on mobile; sticky summary collapses to an expandable bottom bar as in other verticals.
Interaction Notes	Continue proceeds to Personalize Stay (9.5); back-navigation should preserve the selected room from 9.3.

Developer Notes

- Reuses the same ContactInformation sub-component as Flight Passenger Details (8.3) — only the identity fields differ (passport vs. domestic ID) — parameterize by booking-vertical/domestic-vs-international rather than duplicating the form.

9.5 — Personalize Stay (Add-ons)

Screen Name	Personalize Stay (Add-ons)
Purpose	"Enhance Your Stay" upsell screen offering breakfast, airport transfer, early check-in/late check-out and special occasion decoration add-ons.
Business Goal	Ancillary revenue capture specific to hotel stays — breakfast package (+₹3,900) is the highest-value upsell and is flagged "Most Popular" to anchor attention.
User Goal	Add convenience/comfort options relevant to their stay (food, transfers, flexible timing, special occasions) with transparent pricing.
Key Components	3-step progress bar Trip context header Add-on cards (Breakfast Package, Airport Transfer, Early Check-in, Late Check-out, Special Decoration) each with badge/benefit copy/price/+Add Sticky summary (room, dates, guests, price breakdown, cancellation policy)
Design Principles	- Identical add-on card pattern to Flight Personalize (8.5) for cross-vertical consistency — users who've booked a flight on this platform already know how this screen works. "Special Decoration (Romantic)" add-on shows the platform extends beyond utilitarian travel into experience/occasion merchandising (anniversaries, honeymoons).
Visual Hierarchy	"Most Popular" badge on Breakfast Package draws the eye first among otherwise equally-weighted cards.
Layout Analysis	Vertical add-on card stack identical in structure to the Flight Personalize screen, confirming a shared design pattern across verticals.
UX Decisions	- Early Check-in / Late Check-out are framed against the standard time ("Standard check-in is 2:00 PM — request early") so users understand exactly what they're paying to change. - Airport transfer is offered as a simple flat-fee add-on (+ ₹800) rather than requiring flight-detail entry at this stage, keeping the step lightweight.
Accessibility	- Each "+Add" button needs a unique accessible name including the add-on and price, matching the pattern recommended for Flight Personalize. "Most Popular" and similar badges must not be conveyed by color alone.
Responsive Behavior	Same responsive treatment as Flight Personalize — condensed list rows on mobile, sticky summary becomes a bottom bar.

Interaction Notes	• Add-on selection updates the sticky Price Summary in real time; Continue proceeds to the Pre-confirmation Review (9.6).
Developer Notes	• Should share the exact AddOnCard component recommended for Flight Personalize (8.5) — only copy/pricing content differs.

9.6 — Payment — Pre-confirmation Review

Screen Name	Payment — Pre-confirmation Review
Purpose	Read-only booking review (hotel, room, stay dates, bed type, price breakdown) shown immediately before the payment gateway handoff.
Business Goal	Same rationale as the Flight equivalent (8.7) — reduce error/dispute risk and gateway abandonment by giving one final, unambiguous review before charging the card.
User Goal	Confirm the exact room, dates and total price are correct before paying.
Key Components	3-step progress bar - Booking Review block (Hotel, Room, Stay, Bed Type, price breakdown) - Security/policy microcopy ("Free cancellation up to 48 hrs. No charges until confirmed.") - Primary "Pay ₹X Securely" CTA - Sticky summary sidebar
Design Principles	Same redundant-confirmation-before-irreversible-action principle as Flight Pre-confirmation (8.7), applied consistently across verticals.
Visual Hierarchy	"Total Payable" is the largest, boldest figure; CTA button restates it exactly, mirroring the Flight pattern.
Layout Analysis	Single-column review card above the CTA, sticky summary retained at right — structurally identical to 8.7 with hotel-specific fields.
UX Decisions	Cancellation window (48 hrs) is restated here, one click before payment, not just earlier in the funnel — reinforces low perceived risk at the moment of commitment.
Accessibility	Same requirements as Flight Pre-confirmation Review (8.7): structured headings/labels, sufficient CTA contrast, and non-color-dependent state cues.
Responsive Behavior	Collapse duplicate sticky sidebar content on mobile as recommended for 8.7.
Interaction Notes	This is the payment-gateway handoff gate — identical interaction contract to the Flight and Tour/Holiday equivalents.
Developer Notes	Use the shared "Review" template proposed for 8.7 — booking-type-specific fields (Bed Type vs. Seat/M meal) are the only variance.

9.7 — Payment — Method Selection

Screen Name	Payment — Method Selection
Purpose	Coupon entry and payment method selection (UPI/Card/Net Banking/Wallets) for the hotel booking.
Business Goal	Same as Flight Payment (8.6) — support dominant Indian payment rails and last-chance discount codes to maximize completion rate.
User Goal	Apply a coupon if available and pay using their preferred method.
Key Components	Coupon code input + suggested chips (HDFC15/FLY200/FIRSTFLY) Payment method tabs (UPI/Card/Net Banking/Wallets) UPI ID input + app icons + QR fallback "Pay ₹X Securely" CTA Terms/Privacy disclosure Sticky summary sidebar
Design Principles	Identical structure and content pattern to Flight Payment (8.6) — deliberate reuse reduces relearning cost when a user books both a flight and a hotel in one session.
Visual Hierarchy	Same hierarchy as 8.6 — payment tabs primary, "Pay Securely" CTA the single most prominent element.
Layout Analysis	Identical two-panel structure (payment module + sticky summary) as the Flight Payment screen.
UX Decisions	Reusing the exact payment-method UI across verticals (evidenced by identical coupon codes/app icons in the extracted content) confirms this is intended as one shared checkout module, not four separately designed ones.
Accessibility	Same requirements as Flight Payment (8.6): keyboard-operable tabs, text alternatives for payment app icons, live-region coupon feedback.
Responsive Behavior	Same responsive treatment as 8.6.
Interaction Notes	Same interaction contract as 8.6 — coupon state independent of payment-method tab state.
Developer Notes	This screen is functionally identical to Flight Payment (8.6) and Tour/Holiday Payment (10.6/12.7) — strong evidence the PaymentMethodPicker component should be built once and shared across all four verticals rather than per-flow.

9.8 — Booking Confirmation

Screen Name	Booking Confirmation
Purpose	Post-payment confirmation for the hotel booking — booking ID, hotel/room/stay details, payment summary, refund-status stepper, and next actions (voucher, directions, contact hotel).
Business Goal	Close the transaction with confidence, reduce "did my hotel booking actually confirm" anxiety, and cross-sell the app plus capture a satisfaction rating.
User Goal	Get proof of a confirmed hotel booking (Booking ID/voucher) with all stay details in one place, and know how to get directions or contact the property if needed.
Key Components	Success headline + Booking ID with Copy action Hotel Details table (property, location, room, view, star category) Stay Details table (check-in/out, duration, guests, breakfast, cancellation) Payment Summary table (room rate, taxes, total paid, method, transaction ID) Refund-status stepper Booking action buttons (Download Voucher/Email Confirmation/Get Directions/Contact Hotel) Rate-experience + Need-help prompts App download banner + mega-footer
Design Principles	Same layered-density confirmation pattern as Flight Confirmation (8.8): success signal first, then progressively detailed tables.
Visual Hierarchy	Success headline and Booking ID are largest/most prominent; star-rating and view details act as secondary reassurance that the "right" room was booked.
Layout Analysis	Long single-column confirmation document identical in structure to Flight Confirmation, with hotel-specific fields (room view, breakfast inclusion, check-in/out times) replacing flight-specific ones (seat, gate, terminal).
UX Decisions	"Get Directions" and "Contact Hotel" are hotel-specific actions not present in the Flight equivalent — reflects that hotel post-booking needs (navigation, on-property queries) differ from flight needs (check-in, boarding pass). - Cancellation deadline is restated in absolute date form ("Free cancellation until 18 Dec 2024") for clarity versus a relative "48 hrs" framing used earlier in the funnel.
Accessibility	Same requirements as Flight Confirmation (8.8): selectable/copyable Booking ID text, semantic tables, text-labeled refund stepper states.
Responsive Behavior	Same reflow strategy as Flight Confirmation — stacked label/value rows and a vertical action-button group on mobile.

Interaction Notes	• "Get Directions" should deep-link to a maps app/URL using the property's coordinates; "Contact Hotel" should surface a property-specific phone/email, not the generic FlyAnyTrip support line.
Developer Notes	• Build from the same shared ConfirmationTemplate proposed for Flight Confirmation (8.8), swapping in hotel-specific fields and actions. • Note a data inconsistency in the mock: the property name in the header ("Hotel Confirmed!") reads "Taj Exotica Resort & Spa" while the preceding Room Selection/Guest Details steps reference "Radisson Blu Resort" — flag to design/content team to correct before dev handoff.

10.1 — Package Listing

Screen Name	Package Listing
Purpose	Lists all-inclusive tour packages (flights + hotels + sightseeing + meals) filterable by price, star rating, destination and group type.
Business Goal	Sell higher-AOV bundled packages (₹22,999–₹35,000+ per person) versus single-item bookings, increasing average order value and simplifying multi-component itinerary sales.
User Goal	Find a ready-made, all-inclusive trip that matches their destination interest, budget and travel-companion type (family/honeymoon/solo/friends) without planning every component themselves.
Key Components	Category intro header + subcopy explaining the all-inclusive value prop Filter sidebar (Price range, Star rating, Destination, Group Type) Sort control (Popularity/Price/Rating) Result count indicator Package cards (theme tag, duration badge, name, route, rating+reviews, inclusion chips "+N more", price with discount %, "per person," departures count, View Package Details CTA)
Design Principles	- Group Type filter (Family/Honeymoon/Solo/Friends) is a needs-based rather than purely destination-based filter — reflects that trip *purpose* is as important as location for package selection. - Inclusion chips (4-star Hotels/Flights/AC Transport/Breakfast/+2 more) let users instantly gauge bundle value without opening each package.
Visual Hierarchy	Theme tag (Heritage) and duration (5N/6D) sit as small badges above the package name, giving fast categorical scanning before the more detailed price/inclusions are read.
Layout Analysis	Same two-column filter+results template as Flight Screener and Hotel Search Results, reinforcing the platform-wide listing pattern.
UX Decisions	"Departures" count (e.g. "12 departures") signals availability/flexibility of start dates without requiring a calendar click-through at this stage. - Discount percentage is shown explicitly (18% off) alongside both original and final price — consistent with the Hotel and Flight pricing-transparency pattern.
Accessibility	- Inclusion "+N more" chips should be expandable/readable by assistive tech, not a decorative truncation only. - Theme and duration badges need sufficient text contrast against their colored backgrounds.
Responsive Behavior	Filters collapse to modal/bottom-sheet; package cards go single-column full width, matching Hotel/Flight listing responsive behavior.

Interaction Notes	• "View Package Details" navigates to Package Detail (10.2), carrying the selected package's ID/departure context forward.
Developer Notes	• Package card shares ~80% of its structure with the Hotel result card (image/meta/rating/price/CTA) — build from the same shared ListingCard base with an inclusion-chip slot unique to packages. • This screen is visually and structurally identical to the Holiday Package Listing (12.2) — confirm with the client whether Tour Packages and Holidays are meant to be the same catalog with different entry points, or genuinely separate inventories (see Section 13.5).

10.2 — Package Detail & Itinerary

Screen Name

Package Detail & Itinerary

Purpose

Full package page: photo gallery, overview, trip highlights, day-by-day itinerary, included hotels list, and (implied further down) pricing/departure selection.

Business Goal

Justify a high-AOV, multi-day purchase by making the itinerary tangible and credible (named hotels, day-by-day detail, concrete highlights) — the depth of detail here directly supports conversion confidence for an expensive, hard-to-reverse booking.

User Goal

Understand exactly what each day of the trip includes (activities, meals, hotel) before committing, and confirm the specific hotels used are acceptable.

Key Components

Breadcrumb (Home / Tour Packages / [Package])

Photo gallery + "View all N photos"

Package header (name, route, duration, rating, Wishlist/Share/Itinerary PDF)

Overview description

Highlights bullet list

Day-by-Day Itinerary accordion/list (Day N, title, location, description, inclusion icons: Breakfast/Hotel Stay/Transport)

Hotels Included list (city, property, nights)

Design Principles

- "Itinerary PDF" download acknowledges that a purchase this size is often researched/shared offline or discussed with travel companions before booking — a deliberate concession to a longer decision cycle than a flight or single hotel night.
- Day-by-day structure with per-day inclusion icons (✓ Breakfast/✓ Hotel Stay/✓ Transport) builds granular trust — nothing is left ambiguous about what's covered each day.

Visual Hierarchy

Package name, route and duration badge anchor the top; each itinerary day uses a repeated numbered-day pattern so users can quickly scan for the days that matter most to them (e.g. "which day is the Taj Mahal?").

Layout Analysis

Long single-column editorial layout: gallery → header/actions → overview → highlights → day-by-day itinerary (likely the longest section, potentially collapsible per day) → included hotels list → (continues to reviews/booking CTA below the extracted content).

UX Decisions

- Named, specific hotels (Radisson Blu Plaza Delhi, Courtyard by Marriott Agra) rather than a generic "4-star hotel" placeholder — significantly reduces uncertainty for a package purchase.
- Highlights are written as experiential bullet points (e.g. "Sunrise view of the Taj Mahal") rather than a feature list — sells the emotional outcome, not just logistics.

Accessibility	- Day-by-day itinerary, if implemented as an accordion, needs proper expand/collapse ARIA states and keyboard operability per day. - Inclusion icons (✓ Breakfast, etc.) need text labels for screen readers, consistent with other checkmark usage across the file. "Itinerary PDF" link should indicate file type/size to set expectations before download.
Responsive Behavior	- Gallery becomes a single-image swipeable carousel; day-by-day itinerary should default to collapsed per-day accordions on mobile to manage an otherwise very long scroll. - Hotels Included list stacks to single column with city as a clear section label.
Interaction Notes	- Wishlist/Share/Itinerary PDF are secondary actions positioned near the title — should not compete visually with the (assumed, below-the-fold) primary booking CTA. - Clicking through eventually leads to Traveler Details (10.3) once a departure date/traveler count is chosen (mechanism not visible in this exported frame — flag for design to confirm where date/traveler selection happens on this page).
Developer Notes	- This screen and Holiday Package Detail (12.3) share 100% of extracted text content in this Figma file (identical "Golden Triangle Tour" itinerary) — this is very likely a shared template/component reused for both a "Tour Packages" and "Holidays" entry point rather than two independently designed screens; confirm intended catalog relationship with the client before building two separate routes. - Day-by-day itinerary should be data-driven (array of day objects) to support packages of varying length (this file only shows a 6-day example).

10.3 — Traveler Details

The screenshot shows a web form for 'Angirip' titled 'Golden Temple Tour'. It includes a progress bar at the top. The form has several sections: 'Contact Information' with fields for name, email, and phone; 'Number of Travelers' with a stepper set to 2; 'Lead Traveler Details' with fields for title, name, DOB, and nationality; and a 'Fare Summary' on the right showing a total of ₹10,298. A 'Continue' button is at the bottom.

Screen Name	Traveler Details
Purpose	Collects contact info, traveler count, and lead + additional traveler details for the selected package and departure date.
Business Goal	Ensure accurate headcount and traveler data for a multi-day, multi-person booking where errors are costly to correct (hotel rooming, transport seats, visa documents for international packages).
User Goal	Specify how many people are travelling and provide the details needed to lock in the selected departure date and price.
Key Components	3-step progress bar (Fill Your Info/Personalize Trip/Finalize Payment) - Package context header (name, route, duration, departure date, per-person price) - Contact Information form - Number of Travelers stepper (–/count/+) - Lead Traveler Details form (title, name, DOB, nationality) - Additional traveler section (collapsed "+Add Details" per extra traveler, passport fields for international travel) - Sticky Fare Summary (per-person × count, GST, savings, total, cancellation policy)
Design Principles	- Traveler-count stepper directly drives the fare calculation shown in the adjacent sticky summary — tight coupling between input and cost feedback keeps the multi-person math transparent. - Additional travelers are progressively disclosed ("+ Add Details") rather than all shown expanded at once, keeping the initial form manageable for the common 1–2 traveler case.
Visual Hierarchy	Package name/route/duration/price recap at the top re-establishes context (important given the long detail page before this step); "Total Payable"-equivalent in the sticky summary remains the most visually weighted figure.
Layout Analysis	Same –66/34 two-column checkout template as Flight/Hotel, with a traveler-count stepper as the one structurally unique element versus the other verticals (Flight/Hotel don't expose a similar count control at this exact step).
UX Decisions	- Fare summary shows "Savings" as its own explicit line (₹10,002) in addition to base and GST — reinforces deal value at the highest-commitment step of a big-ticket purchase. - Passport requirements are conditionally flagged ("Required for international travel") consistent with the Flight vertical's conditional-document pattern.

Accessibility	• Stepper control (–/2/+) needs accessible increment/decrement buttons with the current count announced on change (aria-live or role="spinbutton"). • Collapsed additional-traveler sections need clear expand/collapse semantics and must not hide required-field errors from assistive tech when collapsed.
Responsive Behavior	• Stepper and form fields stack full-width; sticky fare summary collapses to a bottom bar showing per-person price × count and total.
Interaction Notes	• Incrementing traveler count should dynamically add a new "Traveller N — + Add Details" row and update the fare summary multiplication in real time. • Continue proceeds to Personalize Trip (10.4) once all required lead/additional traveler fields validate.
Developer Notes	• Traveler-count stepper + dynamic additional-traveler rows should be modeled as an array-backed form, similar to the recommendation for Flight Passenger Details, but with a count control driving array length directly. • Identical in structure to Holiday Traveler Details (12.4) — build one shared component parameterized by package type.

10.4 — Personalize Trip (Add-ons)

Screen Name	Personalize Trip (Add-ons)
Purpose	Upsell screen for meal preference and package-specific add-ons (baggage, travel kit, visa assistance, insurance).
Business Goal	Ancillary revenue on a high-AOV product — even a small attach rate on ₹299–₹1,399 add-ons meaningfully increases margin on a package already priced at ₹20,000+.
User Goal	Add relevant conveniences (meal type, baggage, visa help, insurance) for a multi-day trip with international-travel considerations.
Key Components	3-step progress bar Package context header Meal Preference selector (same emoji pattern as Flight) Add-on cards (Extra Baggage 15kg/30kg, Travel Kit, Visa Assistance, Travel Insurance) Sticky Fare Summary
Design Principles	Reuses the exact Flight Personalize card pattern and copy structure (even sharing some placeholder copy, e.g. "Board first, best overhead bin space" mistakenly retained under "Travel Kit") — strong evidence of a shared, not-yet-fully-adapted component.
Visual Hierarchy	Same as Flight/Hotel Personalize — badges ("Popular," "Recommended") draw first attention among otherwise equal-weight cards.
Layout Analysis	Identical vertical add-on card stack to Flight (8.5) and Hotel (9.5) Personalize screens.
UX Decisions	"Visa Assistance" is package-specific and reflects the international-travel context four packages can involve, unlike the domestic-only Hotel vertical.
Accessibility	Same requirements as Flight/Hotel Personalize: unique accessible names per add-on button, non-color-only badges.
Responsive Behavior	Same responsive treatment as Flight/Hotel Personalize screens.
Interaction Notes	Continue proceeds to the Pre-confirmation Review (10.5).
Developer Notes	Content bug found in the source file: the "Travel Kit" and "Visa Assistance" add-on cards still carry Flight-specific benefit copy ("Board first, best overhead bin space" / "Stay connected during the flight") copied over from the Flight Personalize screen — flag to the client's content team to correct before this ships; the AddOnCard component itself is fine to reuse, only the copy needs updating per vertical.

10.5 — Payment — Pre-confirmation Review

Screen Name	Payment — Pre-confirmation Review
Purpose	Read-only review of the package, duration, departure, traveler count, meal choice and full fare breakdown before payment handoff.
Business Goal	Same risk-reduction rationale as the Flight/Hotel review screens, with an added seat-scarcity nudge ("8 seats remaining") specific to fixed-departure packages.
User Goal	Confirm the package, dates and total cost for the whole travelling party before paying.
Key Components	3-step progress bar - Review Your Booking block (package, duration, departure, availability, travelers, meal) - Fare breakdown (Base/GST/Savings/Total Payable) - Security/policy microcopy - Primary "Pay ₹X Securely" CTA - Sticky Fare Summary sidebar
Design Principles	Scarcity messaging ("8 seats remaining") is unique to the fixed-departure package model versus Flight/Hotel (which have effectively unlimited inventory per date) — a legitimate urgency cue given real capacity constraints on group departures.
Visual Hierarchy	Total Payable is the largest figure; scarcity text is a secondary but attention-grabbing element likely styled in the brand red/amber to prompt faster decisions.
Layout Analysis	Same single-column review + CTA + sticky sidebar structure as Flight/Hotel Pre-confirmation Review.
UX Decisions	Restating traveler count and meal choice here (not just price) gives a full "what am I buying" recap appropriate to a complex, multi-day, multi-person purchase.
Accessibility	- Scarcity messaging ("8 seats remaining") must be real-time accurate if used — false urgency is both a UX-trust and potential regulatory/ASA-style risk; flag to the client for backend accuracy confirmation. - Same structural accessibility needs as other Review screens (semantic headings, non-color state cues).
Responsive Behavior	Same mobile treatment as Flight/Hotel Review screens — collapse duplicate sidebar.
Interaction Notes	Same payment-gateway handoff contract as Flight/Hotel Review screens.
Developer Notes	- Seat-availability count should be sourced live from inventory, not hard-coded — critical since this screen doubles as a scarcity/urgency mechanism. - Shares the Review template proposed in 8.7/9.6 with package-specific fields (Departure/Availability/Travelers/M meal).

10.6 — Payment — Method Selection

Screen Name	Payment — Method Selection
Purpose	Coupon entry and payment method selection for the tour package booking.
Business Goal	Same as Flight/Hotel Payment screens — support dominant Indian payment rails and discount codes to maximize completion on a high-AOV purchase where payment hesitation is more costly to lose.
User Goal	Apply a coupon if available and pay securely using their preferred method.
Key Components	- Coupon code input + suggested chips - Payment method tabs (UPI/Card/Net Banking/Wallets) - UPI ID input + app icons + QR fallback "Pay ₹X Securely" CTA - Terms/Privacy disclosure - Sticky Fare Summary sidebar
Design Principles	Identical structure to Flight (8.6) and Hotel (9.7) Payment screens — confirms the shared PaymentMethodPicker hypothesis across all verticals.
Visual Hierarchy	Same as Flight/Hotel Payment — payment tabs primary, CTA the singular highest-contrast action.
Layout Analysis	Identical two-panel structure to Flight/Hotel Payment screens.
UX Decisions	No package-specific variation was found in this step — appropriate, since payment mechanics don't need to differ by product type.
Accessibility	Same requirements as Flight/Hotel Payment screens.
Responsive Behavior	Same responsive treatment as Flight/Hotel Payment screens.
Interaction Notes	Same interaction contract as Flight/Hotel Payment screens.
Developer Notes	Note: the displayed "Pay ₹42,298 Securely" total does not match the ₹48,298 total shown in the adjacent Fare Summary sidebar on this frame — likely a mock-data inconsistency; flag to design/QA to ensure the CTA amount and summary total are always sourced from the same computed value in production.

10.7 — Booking Confirmation

Screen Name	Booking Confirmation
Purpose	Post-payment confirmation for the tour package — booking reference, package/destination/duration/departure-return dates, theme, and traveler details.
Business Goal	Close a high-AOV, high-consideration purchase with clear confirmation and set correct expectations for departure logistics.
User Goal	Get proof of a confirmed package booking with all key trip facts (dates, destinations, theme) in one place.
Key Components	Success headline + Booking Reference with Copy action Package Details table (package, destinations, duration, departure, return, theme) Traveller Details (per the visible heading; full table truncated in this export)
Design Principles	Same success-first, progressively-detailed confirmation pattern as Flight/Hotel Confirmation.
Visual Hierarchy	Success headline and Booking Reference are most prominent; Package Details table follows the same label/value pattern used platform-wide.
Layout Analysis	Long single-column confirmation document, structurally consistent with Flight/Hotel Confirmation screens (this export was cut off before showing the full Payment Summary / refund stepper / action buttons visible on other confirmation screens — assume they exist below the fold, matching the pattern).
UX Decisions	- Explicit "Return" date alongside "Departure" is package-specific — flights/hotels don't need a return-date recap in the same way since it's implicit in a one-way date-range. "Theme" (Heritage & Culture) is restated at confirmation — reinforces the emotional "why" of the purchase even after the transactional job is done.
Accessibility	Same requirements as Flight/Hotel Confirmation: copyable booking reference, semantic tables.
Responsive Behavior	Same reflow strategy as other confirmation screens.
Interaction Notes	Assume this screen continues below the fold with Payment Summary, refund-status stepper, and booking actions (Download Itinerary/Voucher, Email Confirmation, Manage Booking) consistent with Flight/Hotel — confirm full scroll depth with the design team since the current export appears truncated.

Developer Notes

- Build from the shared ConfirmationTemplate; verify with the client whether this frame's full content matches Flight/Hotel Confirmation depth or is intentionally shorter — the extracted layer height (2,848px) is comparable to Hotel Confirmation (2,569px), suggesting the remaining sections exist but weren't captured in this text pass.

11.1 — Support / Help Center

Screen Name	Support / Help Center
Purpose	Self-service help hub: searchable FAQ categories, quick-link topics, three contact channels (chat/email/phone), and a support-ticket form.
Business Goal	Deflect low-complexity queries (refund status, baggage policy, PNR status) to self-service before they become costly live-agent contacts, while still offering assisted channels for issues that need escalation.
User Goal	Get an answer to a specific question fast, either by finding it themselves or by reaching a human through the channel that best matches urgency (chat for immediate, email for detailed, phone for complex/voice-preferred).
Key Components	- Search bar with placeholder examples ("cancel booking", "refund status") - Quick-topic chips (Cancel booking/Refund status/Change date/Baggage policy/Web check-in/PNR status) - Category tabs (Booking & Reservations/Cancellations & Refunds/Payments & Pricing/Baggage) - FAQ accordion list per category - Three contact-channel cards (Live Chat/Email Support/Phone Support) each with SLA microcopy - Support request form (Full Name, Email, and further fields below the fold)
Design Principles	- Each contact channel states its own expected response time up front (chat <2 min, phone hold 3–5 min, email 4–6 hrs) — sets honest expectations instead of a generic "we'll get back to you," which reduces repeat-contact frustration. - Quick-topic chips surface the platform's actual highest-volume support intents (cancellation/refund/date-change) as one-tap shortcuts before users have to type a search query.
Visual Hierarchy	"How can we help you?" + search bar anchors the page; the three contact-channel cards are equally weighted so the choice of channel is left to user preference, not funneled toward one.
Layout Analysis	Single-column stacked layout: hero search → quick topics → FAQ categories/accordion → contact channels (3-card row) → support request form. No sidebar, unlike the booking-flow screens — appropriate since this is a help destination, not a checkout step.
UX Decisions	- FAQ questions are grouped into topical tabs (Booking, Cancellations, Payments, Baggage) rather than one long list — keeps each category scannable. - The support form is positioned last, after search/FAQ/channel options are exhausted — nudges users toward faster self-service before a ticket is filed.

Accessibility	• FAQ accordions need proper expand/collapse semantics (aria-expanded) and keyboard operability. • Contact-channel cards' SLA text ("Avg. wait <2 minutes") should not be the only indicator of channel status — pair with a text label, not color/icon alone. • Search input needs a visible, programmatically associated label beyond the placeholder text.
Responsive Behavior	• Quick-topic chips wrap to multiple rows; 3-card contact-channel row stacks to single column; FAQ category tabs likely convert to a horizontal scroll or dropdown on mobile.
Interaction Notes	• Search bar presumably filters/matches against the FAQ list live or on submit (mechanism not visible in the static export — confirm with design whether it's live-filter or a results page). • "Start Chat" and "Send Email" trigger their respective channel; phone number is presumably tap-to-call on mobile.
Developer Notes	• Build FAQ content as a CMS-driven, categorized array so support content can be updated without a redeploy — this is exactly the kind of content that changes frequently post-launch. • Support request form fields visible (Full Name, Email) continue below the fold — confirm full field list (e.g. booking reference, category, message, attachment) with the design team before building the ticket schema.

11.2 — My Bookings — Cancel Confirmation Modal

Screen Name	My Bookings — Cancel Confirmation Modal
Purpose	Confirmation modal shown when a user initiates "Cancel Booking" on an upcoming trip — shows cancellation charges and net refund before the action is final.
Business Goal	Reduce cancellation-related support tickets and disputes by making the refund math (amount paid, cancellation fee, net refund) explicit and requiring an explicit confirm step, not a single accidental click.
User Goal	Understand exactly how much they will get back before confirming they want to cancel a specific flight booking.
Key Components	- Modal header "Cancel Booking?" with booking PNR reference - Cancellation Charges breakdown (Total paid / Cancellation fee) - Refund amount (highlighted) - Refund-timeline microcopy ("credited within 5–7 business days") "Keep Booking" (secondary) / "Confirm Cancel" (destructive primary) buttons - Underlying My Trips page dimmed behind the modal, still showing both upcoming trips and Quick Help
Design Principles	- The destructive action ("Confirm Cancel") is styled in the brand red and placed to the right, while the safe default ("Keep Booking") is neutral/white and placed to the left — follows the platform-wide convention of putting the reversible/safe choice first. - Refund amount is shown as its own emphasized line rather than buried in the fee breakdown — the number the user cares about most is the easiest to find.
Visual Hierarchy	Modal traps focus over a dimmed background; "Refund amount" is the most visually prominent figure in the modal, above the two action buttons.
Layout Analysis	Centered overlay modal (~450px) over the full My Trips page; background page content (trip cards, Quick Help) remains visible but dimmed/inactive, giving spatial context for what's being cancelled without full navigation away.
UX Decisions	- Showing "Total paid" and "Cancellation fee" as separate line items (not just the net refund) lets the user verify the math themselves — builds trust in an interaction that can otherwise feel adversarial (the platform "keeping" money). - PNR is restated in the modal header so users cancelling from a multi-booking list can confirm they're cancelling the correct trip.

Accessibility	• Modal must trap focus, be dismissible via Escape/overlay click as an alternative to "Keep Booking," and return focus to the triggering "Cancel Booking" button on close. • Destructive action should not rely on red color alone — button carries a text label ("Confirm Cancel"), which is correct; ensure sufficient contrast against the red fill. • Modal needs role="dialog", aria-modal="true", and an accessible name tied to the "Cancel Booking?" heading.
Responsive Behavior	• Modal likely becomes a bottom sheet or near-full-width overlay on mobile, consistent with modal patterns elsewhere in the file.
Interaction Notes	• "Confirm Cancel" transitions the booking to the Cancelled state and triggers the refund process shown in 11.3 (Refund Tracking). • "Keep Booking" or backdrop click dismisses the modal with no state change.
Developer Notes	• Refund calculation (Total paid – Cancellation fee = Refund amount) should be computed server-side against the live fare-rule engine, not hard-coded, since cancellation fees vary by fare type and time-to-departure. • This modal is a variant state of the My Bookings page (25/26/27 share the same base page) — build as a single My Bookings screen with a modal/overlay component and distinct booking-status states, not three separate pages.

COMPONENT SIZES & DIMENSIONS

Full screen canvas size: 1517 × 1988 px

11.3 — My Bookings — Refund Tracking (Post-Cancellation)

Screen Name	My Bookings — Refund Tracking (Post-Cancellation)
Purpose	Shows the post-cancellation state of a booking: status badge changed to "Cancelled" on the trip card, plus a dedicated Refund Requested tracker with a 4-step progress stepper and refund details.
Business Goal	Reduce "where is my refund" support contacts by proactively surfacing refund status and expected date on the same page where the user cancelled — the highest-anxiety moment in a cancellation flow.
User Goal	Confirm their cancellation went through and know exactly when and how much money is coming back.
Key Components	- Trip card with status badge switched to "Cancelled" (red) and "Cancel Booking" action removed/disabled for that card - Refund Requested panel (icon + headline + explanatory copy) 4-step refund stepper (Cancellation Requested → Airline Confirmation → Refund Initiated → Refund Credited), first step marked active/complete - Refund detail chips (Refund Amount / Refund To — masked card / Expected By date)
Design Principles	- The refund stepper mirrors the familiar order-tracking pattern (e-commerce delivery trackers) — borrows a UI convention users already trust to make an abstract backend process ("refund is processing") feel concrete and trackable. - Masked card number ("HDFC Card - XXXX 4521") shown for refund destination reassures the user money is going to the right, recognizable place without exposing full card data.
Visual Hierarchy	"Refund Requested" headline is the primary focus at this point, positioned directly below the Quick Help section, before the footer — the cancelled trip card itself recedes in visual weight compared to the still-active confirmed trip above it.
Layout Analysis	Adds one new section (Refund Requested panel) to the same My Bookings page template used in 11.2/11.4, inserted between Quick Help and the footer — confirms this is a state-append, not a separate page design.
UX Decisions	- Only the first stepper stage ("Cancellation Requested") is shown as active/complete immediately after cancellation — correctly reflects that airline confirmation and refund initiation haven't happened yet, avoiding a false sense of a completed refund. "Expected By" date is shown as a concrete date rather than only a "5–7 business days" range — gives the user a specific day to next check back, reducing repeat visits/contacts before then.

Accessibility	• Stepper must expose current step/progress via text (e.g. "Step 1 of 4") for screen readers, not rely on color/position alone. • Status badge change (Confirmed → Cancelled) needs both the red color and the explicit text label "Cancelled" (already present) — good baseline, verify contrast ratio of red-on-white meets AA.
Responsive Behavior	• Stepper likely switches from horizontal to vertical on mobile to remain legible at narrow widths; refund detail chips stack to a single column.
Interaction Notes	• This state is presumably reached automatically after "Confirm Cancel" in 11.2, and updates live as the airline confirms/refund processes — no direct further user action expected on this panel besides monitoring.
Developer Notes	• Refund stepper state should be driven by a real backend refund-status enum, polled or pushed, not a static 4-step display — build as a status-mapped stepper component reusable for any future refund/dispute flow. • Confirm whether users get a notification (email/SMS/push) at each stepper transition — this panel alone, if not backed by proactive notifications, still requires the user to return to the site to see updates.

11.4 — My Bookings — Default / Base State

Screen Name	My Bookings — Default / Base State
Purpose	Base "My Trips" dashboard: tab counts for Upcoming/Past/Cancelled, list of upcoming bookings each with status, key flight details and per-trip actions, plus a Quick Help panel.
Business Goal	Central retention touchpoint — the page users return to for any post-booking need (details, changes, cancellation, re-booking), reducing dependency on the Support channel for routine tasks.
User Goal	See all their trips at a glance, confirm details of an upcoming flight, and access the specific action (download ticket, change date, cancel) they came for.
Key Components	Page header ("My Trips") + "Book New Flight" CTA Tab bar with counts (Upcoming Trips 2 / Past Trips 2 / Cancelled 1) Trip cards (airline, PNR, departure/arrival time+airport, date, price, status badge, View Details/Download Ticket/Date Change/Cancel Booking actions) Quick Help panel (3 FAQ entries: cancellation, refund timing, modification eligibility)
Design Principles	- Every trip card exposes its four most likely next actions (View/Download/Change/Cancel) directly on the card — no need to open a details page just to perform a routine task, minimizing clicks for common post-booking needs. - Tab counts (2/2/1) give an at-a-glance trip-volume summary before the user even opens a tab — useful for frequent travellers managing several bookings.
Visual Hierarchy	Status badge (green "Confirmed") is the first thing scanned per card after the route/time; price is secondary; the four action links sit in a lower-weight row below.
Layout Analysis	Same base template shared across 11.2/11.3/11.4 — trip-card list + Quick Help + footer; this is the resting/default state with no modal and no cancelled-trip refund panel showing.
UX Decisions	- Quick Help is repeated identically on this page (not just on the dedicated Support page) — anticipates that cancellation/refund questions arise right here, in-context, rather than requiring a detour to Support. - Both listed trips are domestic flights with clear PNR, time and route — consistent with the JetBrains Mono numeric-data styling convention used for codes/times/prices throughout the platform.

Accessibility	- Status badges (Confirmed = green, Cancelled = red seen in 11.3) must not be the only signal — text label is already present, which is correct; verify color contrast for both states. - Action links (View Details, Download Ticket, etc.) need distinguishable accessible names, especially since they repeat identically per card — screen reader users need per-card context (e.g. "Download Ticket, IndiGo FLY8K2M4").
Responsive Behavior	Trip cards likely stack their time/route/price/actions vertically on mobile rather than the current horizontal row layout; tab bar remains horizontal but may become scrollable.
Interaction Notes	"Cancel Booking" opens the confirmation modal (11.2); confirming there transitions the card to the Cancelled + Refund Tracking state (11.3). "Date Change" and "Download Ticket" presumably open their own flows/downloads not captured in this export — flag to confirm scope with design/dev.
Developer Notes	- Build one MyBookings page + TripCard component parameterized by status (Confirmed/Cancelled/Completed) and a slot for the conditional Refund Tracking panel — do not duplicate the page per state as the Figma file structure might suggest (25/26/27 are the same screen in three states, not three designs). - Trip data (airline logo, PNR, times, airports, price, status) should come from a single Booking model reused across My Bookings, Confirmation screens, and any itinerary/ticket PDF generation.

12.1 — Holiday Landing Page

Screen Name

Holiday Landing Page

Purpose

Curated discovery landing page for the Holidays vertical: theme-based browsing (Beach/Mountains/Heritage/Wildlife/Adventure/International) and traveller-type collections (Honeymoon/Family/Solo/Weekend Getaways), plus a Featured Holidays rail.

Business Goal

Position Holidays as a distinct, editorially-curated, higher-emotion product line versus the more utilitarian Tour Packages listing — designed to inspire browsing (and higher AOV bookings) rather than only serve users who arrive with a fixed destination in mind.

User Goal

Get inspired and find a holiday that matches either a destination theme they already like, or a traveller-type situation (honeymoon, family trip, solo, weekend) without knowing the exact destination yet.

Key Components

Eyebrow tag "Curated Holiday Experiences" + H1 "Discover Your Perfect Holiday" + subcopy

Theme chips with counts (Beach 48, Mountains 32, Heritage 26, Wildlife 18, Adventure 22, International 64)

"Holidays for Every Traveller" — 4 traveller-type collection cards (Honeymoon Specialists/Family Holidays/Solo Traveller/Weekend Getaways), each with representative destinations and a package count

"Featured Holidays" rail with "View All" — package cards (theme tag, duration, destination, rating, package name)

Design Principles

- This screen leads with emotional/aspirational framing ("Discover Your Perfect Holiday," "Freedom to explore at your pace") rather than transactional filters — a deliberate top-of-funnel inspiration layer that Tour Packages' listing page (10.1) does not have, since Tour Packages assumes higher purchase-intent.
- Traveller-type collections (Honeymoon/Family/Solo/Weekend) mirror the Group Type filter used later in Tour Packages (10.1) — the same audience segmentation is expressed as inspiration content here and as a filter control there.

Visual Hierarchy

Hero headline and theme chips (with counts, signalling depth of inventory) sit above the fold; the four traveller-type cards get equal visual weight as parallel entry points; Featured Holidays acts as a lower-commitment "browse now" rail beneath.

Layout Analysis

Vertical magazine-style landing page: hero → theme chip row → 4-card traveller-type grid → featured package rail — structurally different from every other listing page in the file (Flight/Hotel/Tour Packages all go straight to a filter+results template with no inspirational landing layer).

UX Decisions	- Package counts shown per theme and per traveller-type collection (e.g. "35 packages," "64" for International) let users gauge inventory depth before clicking in, reducing dead-end clicks into thin categories. - Each traveller-type card names specific destinations (Maldives/Bali/Kerala/Paris for Honeymoon) as a preview, giving concrete signal before the user commits to opening that collection.
Accessibility	- Theme chips with counts need the count exposed as part of the accessible name (e.g. "Beach, 48 packages"), not a visually separate, unlabeled number. - Traveller-type cards should be a single accessible link/region per card, not a cluster of separately-focusable destination chips with an ambiguous overall target.
Responsive Behavior	Theme chip row becomes horizontally scrollable; traveller-type 4-card grid stacks to 2-column then 1-column; Featured Holidays rail becomes a swipeable carousel.
Interaction Notes	- Clicking a theme chip or traveller-type card is expected to route into the Holiday Packages listing (12.2) pre-filtered by that theme/traveller type. "View All" on Featured Holidays routes to the full Holiday Packages listing unfiltered.
Developer Notes	- This landing layer has no equivalent in Tour Packages — confirm with the client whether Holidays is intentionally meant to be the "inspirational front door" for the same underlying package inventory used by Tour Packages (see 12.2/12.3 note on shared content), with Tour Packages serving as the direct-intent listing. - Theme and traveller-type taxonomies (Beach/Mountains/Heritage/Wildlife/Adventure/International and Honeymoon/Family/Solo/Weekend) should be modeled as filterable tags on the same Package entity used by Tour Packages, not a separate content type, to avoid duplicate catalog maintenance.

COMPONENT SIZES & DIMENSIONS

12.2 — Holiday Packages Listing

Screen Name	Holiday Packages Listing
Purpose	Filterable results grid for holiday/tour packages — filter sidebar (Price, Star Rating, Destination, Group Type) plus sortable package cards.
Business Goal	Convert inspired browsers from the Landing Page (12.1) into package selections, using the same trust-building levers (rating counts, inclusion chips, transparent discount pricing) proven in the Tour Packages and Hotel listings.
User Goal	Narrow down from "inspired" to a specific bookable package matching budget, destination and travel-companion type.
Key Components	Header "Tour Packages & Holiday Deals" + subcopy ("Flights + Hotels + Sightseeing + Meals") Filter sidebar (Price Range slider, Star Rating tiers, Destination checkboxes, Group Type checkboxes) with Reset All Result count ("6 package found") Sort control (Popularity/Price ↑/Rating) Package cards (theme tag, duration badge, name, route, rating+review count, inclusion chips "+N more", price with discount %, per-person label, departures count, View Package Details CTA)
Design Principles	Uses the identical filter+grid template as Tour Packages (10.1) — same Price/Star Rating/Destination/Group Type filter set, same card anatomy — reinforcing one shared underlying data/component model rather than a bespoke Holidays design.
Visual Hierarchy	Same as Tour Packages listing: theme + duration badges lead, name/route/rating follow, price and CTA anchor the bottom of each card.
Layout Analysis	Identical two-column filter-sidebar + results-grid layout to Tour Packages (10.1) and Hotel Search Results (9.2).
UX Decisions	Header copy ("Tour Packages & Holiday Deals") literally combines both vertical names — strong signal (see developer note) that this listing page serves both navigation entry points from a single shared inventory.
Accessibility	Same requirements as Tour Packages listing (10.1): expandable inclusion chips, sufficient badge contrast, accessible filter controls with current-state announcements.
Responsive Behavior	Same responsive collapse pattern as Tour Packages/Hotel listings — filters to modal/bottom sheet, cards to single column.
Interaction Notes	"View Package Details" routes to Holiday Package Detail (12.3), carrying the selected package/departure forward.

Developer Notes

- **FLAGGED OBSERVATION:** this screen's extracted text/copy — including the page header, filter set, result count, and the first package card ("Golden Triangle Tour," Delhi·Agra·Jaipur, ₹22,999, 12 departures) — is 100% identical to the Tour Packages Listing (10.1). This is the strongest evidence in the file that Tour Packages and Holidays are the same catalog surfaced via two navigation entry points (or this frame was duplicated as a placeholder and not yet differentiated). Recommend confirming directly with the client before deciding whether to build one shared PackageListing route with two entry paths, or intentionally fork the inventory/content per vertical.
- Build from the same ListingCard + FilterSidebar components already specified for Tour Packages (10.1) rather than duplicating code.

12.3 — Holiday Package Detail & Itinerary

Screen Name

Holiday Package Detail & Itinerary

Purpose

Full package detail page — gallery, overview, highlights, day-by-day itinerary — for the selected holiday package.

Business Goal

Same as Tour Packages Detail (10.2): build enough itinerary-level trust and specificity to justify a high-AOV, multi-day purchase decision.

User Goal

Understand the full day-by-day plan, inclusions and highlights of the specific holiday package before proceeding to book.

Key Components

Breadcrumb (Home / Tour Packages / [Package])

"View all 18 photos" gallery link

Package header (name, route, duration, rating, Wishlist/Share/Itinerary PDF)

Overview paragraph

Highlights bullet list

Day-by-Day Itinerary (Day 1–6, title, location, description, inclusion icons)

Design Principles

- Identical granular day-by-day trust-building pattern as Tour Packages Detail (10.2) — per-day inclusion icons, named highlights, specific day locations.

Visual Hierarchy

Same as 10.2: package name/route/duration/rating anchor top; each day uses a repeated numbered pattern for fast scanning.

Layout Analysis

Same long single-column editorial layout as Tour Packages Detail (10.2): gallery → header/actions → overview → highlights → day-by-day itinerary (continues below the exported content, presumably into hotels-included/reviews/booking CTA).

UX Decisions

- Breadcrumb reads "Home / Tour Packages / [Package]" even on a page reached via the Holidays nav — reinforces that Holidays and Tour Packages resolve to the same underlying package route (see developer note).

Accessibility

- Same requirements as Tour Packages Detail (10.2): accordion ARIA states if itinerary collapses per day, text labels for inclusion checkmark icons, Itinerary PDF file-type/size disclosure.

Responsive Behavior

- Same responsive treatment as Tour Packages Detail — single-image swipeable gallery, itinerary collapses to per-day accordions on mobile.

Interaction Notes

- Proceeds to Holiday Traveler Details (12.4) once a departure date/traveler count is selected (selection mechanism not visible in this exported frame, same open question flagged for 10.2).

Developer Notes

- **FLAGGED OBSERVATION:** this screen's extracted content is textually identical (100% match, same "Golden Triangle Tour" 6-day Delhi–Agra–Jaipur itinerary, same highlights, same breadcrumb reading "Tour Packages" rather than "Holidays") to the Tour Packages Package Detail screen (10.2). Combined with the identical listing page (12.2), this strongly indicates Tour Packages and Holidays share one Package Detail template/route in the intended product, with Holidays likely meant only as an alternate discovery entry point (the Landing Page, 12.1) rather than a parallel catalog. Flag this explicitly to the client as a build-efficiency opportunity (one shared PackageDetail component/route) rather than a design defect — but confirm intent before finalizing IA.
- If Holidays and Tour Packages are confirmed to be genuinely separate inventories going forward, this screen needs real Holiday-specific content before development; if shared, build one PackageDetail component/route serving both nav entry points.

COMPONENT SIZES & DIMENSIONS

12.4 — Holiday Traveler Details

Screen Name	Holiday Traveler Details
Purpose	Collects traveler count and lead + additional traveler details, with a sticky fare summary and departure recap, for the selected holiday package.
Business Goal	Same rationale as Tour Packages Traveler Details (10.3) — accurate headcount/traveler data for a costly, hard-to-correct multi-person, multi-day booking.
User Goal	Specify traveler count and provide the details required to lock in the selected holiday departure and price.
Key Components	- Traveler-count stepper (Adults, ~12/+) - Lead Traveler Details form (Title, First/Last Name, DOB, Nationality) - Additional traveler prompt ("1 additional traveller required," Traveller 2 "+ Add Details") - Passport fields (flagged "Required for international travel") - Continue CTA - Sticky package/fare summary sidebar (package name, duration, departure date, traveler stepper, fare breakdown: base × count, GST, Savings, Total) - App-download promo banner + full site footer visible below
Design Principles	Identical fare-transparency and progressive-disclosure pattern as Tour Packages Traveler Details (10.3): traveler-count stepper directly drives the visible fare math; additional travelers are added via "+ Add Details" rather than shown expanded by default.
Visual Hierarchy	Same as 10.3: package recap + price at top, "Total" in the sticky sidebar remains the most visually weighted figure.
Layout Analysis	Same two-column checkout template as Tour Packages Traveler Details (10.3) — this export additionally captured the app-download promo banner and full footer below the form, confirming the page-end structure shared platform-wide.
UX Decisions	Same explicit "Savings" line item (₹10,002) shown alongside base and GST in the fare summary, reinforcing deal value at the highest-commitment step, identical to 10.3.
Accessibility	Same requirements as Tour Packages Traveler Details (10.3): accessible stepper controls with live count announcements, non-hidden validation errors in collapsed additional-traveler sections.
Responsive Behavior	Same responsive treatment as Tour Packages Traveler Details — stacked full-width form, sticky sidebar collapses to a bottom bar.
Interaction Notes	Continue proceeds to Holiday Personalize (12.5) once required lead/additional traveler fields validate.

Developer Notes

- FLAGGED OBSERVATION: fare figures ($\text{₹}22,999 \times 2 = \text{₹}45,998$, GST $\text{₹}2,300$, Savings $\text{₹}10,002$, Total $\text{₹}48,298$), departure date (20 Dec 2024) and package name ("Golden Triangle Tour," 5N/6D) are identical to Tour Packages Traveler Details (10.3) — consistent with the shared-catalog pattern already flagged at 12.2/12.3. Build this as the same TravelerDetailsForm + FareSummary components used for Tour Packages, parameterized by package data rather than duplicated per vertical.

COMPONENT SIZES & DIMENSIONS

Full screen canvas size: 1519 × 2201 px

Component / Frame	Size (W × H)
Main Layout	1393 × 1073 px
Grid Layout	1393 × 783 px

12.5 — Holiday Personalize (Add-ons)

Screen Name	Holiday Personalize (Add-ons)
Purpose	Upsell screen for meal preference and package add-ons (baggage, travel kit, visa assistance, insurance) for the holiday booking.
Business Goal	Ancillary revenue capture on a high-AOV holiday package, identical rationale to Tour Packages Personalize (10.4).
User Goal	Select meal preference and any relevant add-ons (baggage, travel kit, visa help, insurance) for the trip.
Key Components	- Meal Preference selector (☐ Vegan +₹329 / ☐ Jain +₹299 / No Preference Free) - Add-on cards: Extra Baggage 15kg (+₹799), Extra Baggage 30kg "Better value" (+₹1,399), Travel Kit "Popular" (+₹299), Visa Assistance (+₹499), Travel Insurance "Recommended" (₹149, ₹5L coverage/trip cancellation/medical emergency/baggage loss) - Continue CTA - Sticky package/fare summary sidebar
Design Principles	Same badge-driven attention pattern as Flight/Hotel/Tour Packages Personalize screens ("Popular," "Better value," "Recommended") to guide add-on selection without hard-blocking any option.
Visual Hierarchy	Same as Tour Packages Personalize (10.4): badges draw first attention among otherwise equal-weight add-on cards.
Layout Analysis	Identical vertical add-on card stack + sticky sidebar layout to Flight (8.5), Hotel (9.5) and Tour Packages (10.4) Personalize screens.
UX Decisions	Meal options priced individually (Vegan +₹329, Jain + ₹299) rather than bundled — lets price-sensitive users opt for the free "No Preference" without losing dietary accommodation entirely.
Accessibility	Same requirements as other Personalize screens: unique accessible names per add-on button/price, badges not color-only.
Responsive Behavior	Same responsive treatment as other Personalize screens.
Interaction Notes	Continue proceeds to Holiday Payment — Pre-confirmation Review (12.6).

Developer Notes

- **FLAGGED OBSERVATION:** this repeats the same content bug already flagged at Tour Packages Personalize (10.4) — "Travel Kit" ("Board first, best overhead bin space") and "Visa Assistance" ("Stay connected during the flight") still carry Flight-specific benefit copy copied over from the Flight Personalize screen. Since this appears identically in both the Tour Packages and Holiday versions of this screen, it is very likely one shared component/content source — flag once to the client's content team to fix at the source rather than as two separate bugs.
- Reuse the same AddOnCard + MealSelector components already specified for Flight/Hotel/Tour Packages Personalize; only copy needs per-vertical correction.

COMPONENT SIZES & DIMENSIONS

Full screen canvas size: 1519 × 2201 px

12.6 — Holiday Payment — Pre-confirmation Review

Screen Name	Holiday Payment — Pre-confirmation Review
Purpose	Read-only review of travelers, meal choice and fare breakdown before payment handoff, with a seat-scarcity nudge.
Business Goal	Same risk-reduction/last-check rationale as Tour Packages Review (10.5), with the same fixed-departure scarcity cue ("8 seats remaining").
User Goal	Confirm traveler count, meal choice and total cost for the holiday package before paying.
Key Components	- Scarcity microcopy ("8 seats remaining") - Review block (Travellers: 2 adults, Meal: No Preference) - Fare breakdown (Base ₹45,998 / GST ₹2,300 / Savings ₹10,002 / Total Payable ₹48,298) - Security/policy microcopy ("Free cancellation up to 30 days before departure. No charges until confirmed.") - Primary "Pay ₹48,298 Securely" CTA - Sticky Fare Summary sidebar - App-download promo banner + full footer visible below
Design Principles	Identical scarcity + review-before-pay pattern as Tour Packages Review (10.5) — same "8 seats remaining" cue, appropriate given holiday packages share the same fixed-departure inventory model.
Visual Hierarchy	Total Payable is the largest figure; scarcity text is a secondary but attention-grabbing element, matching 10.5.
Layout Analysis	Same single-column review + CTA + sticky sidebar structure as Tour Packages Pre-confirmation Review (10.5).
UX Decisions	Unlike the Tour Packages review, here the primary CTA total (₹48,298) matches the sticky sidebar Total exactly — no mismatch found on this screen (contrast with the discrepancy flagged at 10.6/12.7 below).
Accessibility	Same requirements as other Review screens: real-time-accurate scarcity messaging, semantic headings, non-color-only status cues.
Responsive Behavior	Same mobile treatment as other Review screens.
Interaction Notes	Same payment-gateway handoff contract as Flight/Hotel/Tour Packages Review screens.

Developer Notes

- Same guidance as Tour Packages Review (10.5): seat-availability count must be sourced live from real inventory, not hard-coded, given its role as a genuine urgency/scarcity signal on a fixed-departure product.
- Build from the same shared Review/ConfirmationSummary template used across Flight/Hotel/Tour Packages, parameterized by package fields.

- Drop Shadow: x0 y1 blur2 spread-1 rgba(0,0,0,0.10)
- Drop Shadow: x0 y1 blur3 spread0 rgba(0,0,0,0.10)
- Inner Shadow: x0 y5 blur35 spread8 rgba(0,0,0,0.15)

Total shadow/blur effect instances on this screen: 4

12.7 — Holiday Payment — Method Selection

Screen Name	Holiday Payment — Method Selection
Purpose	Payment method selection (Card/Net Banking/Wallets/UPI) for the holiday booking, with UPI ID input, app icons and QR fallback.
Business Goal	Same as all other Payment screens — support dominant Indian payment rails to maximize completion on a high-AOV purchase.
User Goal	Pay securely using their preferred method.
Key Components	- Payment method tabs (Credit/Debit Card, Net Banking, Wallets, UPI) - UPI ID input + Popular UPI Apps (GPay/PhonePe/Paytm/BHIM) + "Or scan QR code" "Pay ₹42,298 Securely" CTA - Terms & Conditions/Privacy Policy disclosure - Sticky Fare Summary sidebar showing Total ₹48,298 - App-download promo banner + full footer
Design Principles	Identical structure to Flight (8.6), Hotel (9.7) and Tour Packages (10.6) Payment screens — confirms one shared PaymentMethodPicker component used across every vertical.
Visual Hierarchy	Payment tabs primary, CTA the singular highest-contrast action — same as all other Payment screens.
Layout Analysis	Identical two-panel structure (payment form + sticky sidebar) to every other vertical's Payment screen.
UX Decisions	No holiday-specific variation found at this step, appropriately — payment mechanics are vertical-agnostic.
Accessibility	Same requirements as all other Payment screens.
Responsive Behavior	Same responsive treatment as all other Payment screens.
Interaction Notes	Same interaction contract as all other Payment screens — successful payment proceeds to Holiday Confirmation (12.8).
Developer Notes	FLAGGED OBSERVATION: the exact same CTA/sidebar-total mismatch already flagged at Tour Packages Payment (10.6) recurs here — the "Pay ₹42,298 Securely" CTA amount does not match the ₹48,298 Total shown in the adjacent Fare Summary sidebar. Since this discrepancy appears on both the Tour Packages and Holiday versions of this screen with the same two specific numbers, it is very likely a single shared mock-data/component bug rather than two independent errors — flag once to design/QA and confirm the CTA and summary total are always computed from the same source value in production.

12.8 — Holiday Booking Confirmation

Screen Name	Holiday Booking Confirmation
Purpose	Post-payment confirmation for the holiday booking — success headline, Holiday Booking ID with copy action, confirmation-email notice, and a Package Details table (destinations, further fields truncated in this export).
Business Goal	Close a high-AOV, high-consideration holiday purchase with clear confirmation, matching the trust/expectation-setting pattern used at every other vertical's confirmation step.
User Goal	Get proof of a confirmed holiday booking with a reference ID and key trip facts in one place.
Key Components	Success headline "Holiday Confirmed!" + subcopy "Paradise awaits — your holiday is all set!" Holiday Booking ID (format HOL-MLD-7201F) with Copy action "Confirmation sent to user@email.com" notice Package Details table (Package: Golden Triangle Tour, Destinations, further rows truncated in this export) Full site header/footer (nav, Support links, Company links, copyright/certifications) captured around the confirmation content
Design Principles	- Same success-first, progressively-detailed confirmation pattern as every other vertical's Confirmation screen (Flight 8.8, Hotel 9.8, Tour Packages 10.7) — headline and reference ID lead, structured details follow. - Booking-ID prefix "HOL-" distinguishes holiday confirmations from flight ("FLY-") and other verticals at a glance, useful for support agents cross-referencing booking types by ID pattern alone.
Visual Hierarchy	Success headline and Booking ID (with one-tap Copy) are most prominent; Package Details table follows the platform-wide label/value convention.
Layout Analysis	Long single-column confirmation document, structurally consistent with Flight/Hotel/Tour Packages Confirmation screens; this export captured mainly the header/footer chrome plus the top of the Package Details table — the fuller Traveller Details/Payment Summary/action-buttons content (visible on other confirmation screens) is assumed to continue below the fold.
UX Decisions	"Paradise awaits" tagline is more evocative/emotional than the Flight/Hotel confirmation copy — appropriate given Holidays' positioning as an aspirational, leisure-first product versus the more transactional Flight/Hotel verticals.
Accessibility	Same requirements as other Confirmation screens: copyable booking reference with an accessible action label, semantic table markup for Package Details.
Responsive Behavior	Same reflow strategy as other Confirmation screens.

Interaction Notes	Assume this screen continues below the fold with Traveller Details, Payment Summary, and booking actions (Download Itinerary/Voucher, Email Confirmation, Manage Booking) consistent with every other vertical's Confirmation screen — confirm full scroll depth with the design team since the current export appears truncated before showing the complete Package Details table.
Developer Notes	Package Details field naming (Package: "Golden Triangle Tour" — same package name used across the Tour Packages flow) reinforces the shared-inventory pattern already flagged at 12.2/12.3/12.4 — build from the same ConfirmationTemplate + Booking model used for Tour Packages Confirmation (10.7), parameterized by a `bookingType: "tour"   "holiday"` field driving only the ID prefix and cosmetic copy ("Paradise awaits" vs. generic success text), not a separately duplicated screen.

7. User Journey Map

FlyAnyTrip supports four parallel purchase journeys that all resolve to the same five-stage shape: **Discover** → **Decide** → **Configure** → **Pay** → **Confirm**. Below is each journey mapped to its documented screens.

Flight Journey	Home (00) → Flight Screener/Results (01–02) → Flight Detail/Fare Selection (03) → Passenger Details (04) → Seat & Baggage Selection (05) → Personalize / Add-ons (06) → Payment Review (07) → Payment Method (08) → Confirmation (09... mapped as idx 1–8 in Section 4).
Hotel Journey	Home → Hotel Search Results → Hotel Detail/Room Selection → Guest Details → Personalize (add-ons) → Payment Review → Payment Method → Confirmation (idx 9–16, Section 5).
Tour Package Journey	Package Listing → Package Detail & Itinerary → Traveler Details → Personalize (add-ons) → Payment Review → Payment Method → Booking Confirmation (idx 17–23, Section 6).
Holiday Journey	Holiday Landing Page (inspirational entry, unique to this vertical) → Holiday Packages Listing → Package Detail & Itinerary → Traveler Details → Personalize → Payment Review → Payment Method → Confirmation (idx 28–35, Section 8).
Post-Booking Journey	My Trips dashboard (default state) → optional Cancel Booking modal → Refund Tracking state; or → Support / Help Center for any self-service or assisted query (idx 24–27, Section 7).

Key journey insight: The Holiday journey is the only one with a dedicated top-of-funnel inspiration layer (Landing Page, 12.1) before the standard listing template — every other vertical assumes the user arrives with defined intent (a route, a city, a destination) already in mind. This is the single clearest differentiator between "Tour Packages" (direct-intent) and "Holidays" (inspiration-led) as currently designed, even though their downstream screens (listing → detail → traveler → personalize → payment → confirmation) are near-identical in content — see Section 13.5 for the full shared-template observation.

8. Navigation Flow

- **Global primary nav** (present on every screen): Flights · Hotels · Tour Packages · Holidays · My Bookings · Support, plus a top utility bar (Locale/Currency selector, Help Center, Offers & Deals, Corporate Travel, 24/7 phone number) and auth actions (Sign Up Free / Login).
- **Active-state convention:** The current section's nav label switches to full-opacity dark text (#272727) while inactive labels sit at a muted grey (#6B6B6B) — used consistently to orient users within the 6-section IA at all times.
- **Vertical entry points:** Each of the 4 booking verticals (Flight/Hotel/Tour/Holiday) is reachable both from the top nav and from the Home page's category/search modules — Home acts as the universal hub linking out to all four journeys.
- **Linear checkout flow:** Once inside any booking vertical, navigation becomes strictly linear and forward-only via a persistent step-progress bar — there is no lateral nav to other verticals mid-checkout, which is the correct pattern to avoid abandoning an in-progress purchase.
- **Post-purchase loop-back:** Every Confirmation screen and the My Bookings dashboard link back to "Book New Flight" / equivalent, closing the loop back into the top-of-funnel journeys.
- **Support access:** Support/Help Center is reachable from the persistent top nav on every screen (not just post-purchase), reflecting its role as a cross-cutting utility rather than a step in any one journey.

9. Component Library Summary

Recurring components identified across the 36 screens, by frequency of use:

Global Navbar	Appears on all 36 screens (3 dedicated Navbar component frames exist in the file separate from the 36 screens). Utility bar + primary nav + auth actions, with an active-tab state variant.
ListingCard	Used for flight results, hotel results, tour package cards, and holiday package cards — same anatomy (image/meta, rating, price + discount, CTA) with a vertical-specific info slot (inclusion chips, room type, duration badge).
FilterSidebar	Shared across Flight Results, Hotel Results, Tour Packages Listing, Holiday Packages Listing — price range, star rating, and vertical-specific facets (Group Type, Destination, Airline, etc.), with a Reset All action.
StepProgressBar	3–4 step linear progress indicator anchoring every checkout flow (e.g. Fill Your Info → Personalize Trip → Finalize Payment) across all four verticals.
StickyFareSummary	Persistent right-hand sidebar card repeated on every Traveler Details / Personalize / Payment Review / Payment Method screen across all verticals — base fare, taxes, savings, total, cancellation policy.
AddOnCard	Personalize/upsell card used identically for Flight, Hotel, Tour and Holiday add-ons (baggage, insurance, travel kit, visa assistance, meal preference), differentiated only by copy and price.
PaymentMethodPicker	Tabbed payment selector (UPI/Card/Net Banking/Wallets) with coupon input, reused identically across all four verticals' Payment — Method Selection screens.
ReviewSummaryBlock	Read-only pre-payment recap ("Review Your Booking") reused across all four verticals' Payment — Pre-confirmation Review screens.
ConfirmationTemplate	Success-first confirmation layout (headline, booking reference + copy action, details table) reused across all four verticals' final Confirmation screens.
TripCard / BookingStatusBadge	My Bookings dashboard card with status-driven variants (Confirmed/green, Cancelled/red) and conditional action set (View/Download/Change/Cancel).
CancelBookingModal	Overlay confirmation dialog with fee breakdown, used at the My Bookings cancellation entry point.
RefundStepper	4-stage horizontal progress tracker (Cancellation Requested → Airline Confirmation → Refund Initiated → Refund Credited) shown on a cancelled booking.
Footer	Full-width dark footer (app promo banner, 4-column link groups, social icons, legal/certification row) repeated identically at the bottom of every screen in the file.

10. Design System Overview — Cross-Vertical Consistency

- **Single design language, four skins:** Every one of the 36 screens is built from the same ~13 components listed in Section 9 — the platform's visual and interaction consistency is a genuine strength; a user who learns the Flight checkout already knows how to book a Hotel, Tour or Holiday.
- **Transactional trust is the throughline:** Fare transparency (base + GST + savings + total shown at every step), explicit cancellation/refund policy text, and repeated security/PCI/IATA marks appear on nearly every screen — this is the system's core UX strategy for a purchase category where trust is the primary conversion blocker.
- **Data vs. copy typographic split:** The Quicksand (friendly copy) / JetBrains Mono (precise data) pairing described in Section 4 is applied with near-perfect consistency across all verticals — a well-executed, distinctive system decision worth calling out to the client as differentiated from typical OTA competitors.

11. Reusable Components — Build Recommendations

For engineering handoff, the following build order is recommended, front-loading the components with the highest reuse count (per Section 9):

1. **Navbar** (used on all 36 screens) + **Footer** (all 36 screens) — build first as the app shell.
2. **StepProgressBar** + **StickyFareSummary** — shared checkout scaffolding used across all four verticals' mid-funnel screens.
3. **ListingCard** + **FilterSidebar** — parameterized by vertical (flight/hotel/tour/holiday) to serve all four listing pages from one component pair.
4. **AddOnCard** + **MealSelector** — one shared upsell component set; requires a content-only fix per the flagged copy bug in Section 13.5 before shipping.
5. **PaymentMethodPicker** + **ReviewSummaryBlock** + **ConfirmationTemplate** — one shared payment/confirmation pipeline for all verticals; requires the CTA/total consistency fix flagged in Section 13.5.
6. **TripCard**, **BookingStatusBadge**, **CancelBookingModal**, **RefundStepper** — post-booking management components, lower reuse count but highest support-deflection value.

Building in this order means ~70% of all 36 screens can be assembled from the first three component groups alone, with only vertical-specific copy/data as the remaining work.

12. Final Design Summary

FlyAnyTrip's Figma file documents a coherent, production-ready OTA design system spanning 36 screens across four booking verticals (Flights, Hotels, Tour Packages, Holidays) plus a shared My Bookings & Support utility. The system's core strength is **consistency-through-componentization**: nearly every screen is assembled from the same ~13 shared components (Section 9), the same fare-transparency and trust-signal patterns repeat at every checkout step, and a disciplined two-typeface system cleanly separates marketing copy from transactional data.

The most valuable finding for the client from this documentation pass is the **Tour Packages / Holidays overlap**: five of Holidays' eight screens (12.2–12.8, excluding the unique Landing Page) are textually and structurally identical to their Tour Packages counterparts. This is either an intentional shared-catalog architecture (Holidays as an inspirational front door into the same package inventory Tour Packages serves directly) or an unfinished duplication that still needs Holiday-specific content — either way, it is a decision the client should make explicitly before development, and it directly affects how much unique design/content work remains versus how much can be achieved through shared components.

Two smaller data-accuracy issues were also flagged for design/QA follow-up: leftover Flight-specific copy on the Tour/Holiday Personalize add-on cards (Section 13.5), and a CTA-vs-summary total mismatch on the Tour/Holiday Payment Method screens (Section 13.5). Neither blocks development — both are one-line content/data-binding fixes once confirmed.

Recommended next steps: (1) confirm the Tour Packages/Holidays catalog relationship with the client, (2) resolve the two flagged content/data bugs, (3) build the shared component library in the priority order set out in Section 11, (4) commission explicit mobile/tablet frames, since the current file is desktop-only and all responsive guidance in this document is a recommendation, not a designed spec.

13. Appendix — Flagged Observations (Cross-Reference)

13.1	Tour Packages Listing (10.1) and Holiday Packages Listing (12.2) share 100% identical extracted copy — same header, filter values, result count, and first package card. See Section 6/8 developer notes.
13.2	Tour Packages Detail (10.2) and Holiday Package Detail (12.3) share the identical "Golden Triangle Tour" 6-day itinerary content, including the breadcrumb reading "Tour Packages" even from the Holidays entry point. See Section 6/8 developer notes.
13.3	Tour Packages Traveler Details (10.3) and Holiday Traveler Details (12.4) share identical fare figures, departure date, and package name.
13.4	Tour Packages Personalize (10.4) and Holiday Personalize (12.5) both retain leftover Flight-specific copy on the "Travel Kit" and "Visa Assistance" add-on cards ("Board first, best overhead bin space" / "Stay connected during the flight") — a content bug to fix at the source, likely a single shared component.
13.5	Tour Packages Payment — Method Selection (10.6) and Holiday Payment — Method Selection (12.7) both show a CTA total (₹42,298) that does not match the adjacent Fare Summary sidebar total (₹48,298) — a mock-data/data-binding inconsistency to confirm with design/QA before build.
13.6	My Bookings (25/26/27) are three states of one page (default, cancel-confirmation modal, post-cancellation refund-tracking) rather than three separate designs — build as one page with state variants, not three routes.
13.7	No shared Figma color/text styles exist in the source file (all values are raw hex/font properties on individual layers) — the Color Guide and Typography Guide in this document were built by aggregating and de-duplicating those raw values; recommend the design team formalize these into named Figma styles/tokens as a follow-up task.
